**THIS COMPLETE, SIMPLE, PRACTICAL COURSE
FOR SELF-INSTRUCTION WILL QUICKLY GIVE YOU**

a complete mastery of
Mathematics

GE T a better job in America's war industries—and prepare for the coming opportunities after the war—learn mathematics. Mathematics is the basic requirement of all mechanical and scientific work, and of all business or industry based on science. Without this essential knowledge even the most capable man is left behind while others forge ahead to better jobs, bigger contracts, more money. You need mathematics to understand all technical work, to supervise operations, to improve, speed up and check on your work and the work of others. Such basic training is quickly recognized today and gladly paid for. It singles you out from the crowd and gives you an advantage whether it is a matter of a job, a promotion or a contract.

Now you can learn mathematics by an easy inexpensive and time-saving method. This very simple and extremely interesting course in book form has been prepared for you by an expert who has devoted a lifetime to teaching practical men the fundamentals of this important subject.

**A Complete Course and Reference Library in
These Five Volumes • 1,598 Pages • Illustrated**

MATHEMATICS FOR SELF STUDY starts right from the beginning with a review of arithmetic that gives you all special short cuts and trick problems that save countless hours of your time and make you more valuable to yourself and your job. Then these books go right into higher mathematics and show how simple it is when an expert explains it for you.

**An Expert Gives You His
Simplified Methods**

Mr. Thompson, the author of these books, is not an ordinary teacher of mathematics. He has had many years experience in giving students the kind of mathematical training they need in practical work. He presents each practical method and problem in the clearest and simplest way. He gets right down to the kind of information that you need in your daily work.

Don't let appearances fool you, mathematics is easy. You can get these books on approval and see for yourself how much enjoyment you will have while getting this valuable training and solving interesting practical problems that puzzle your friends and fellow workers. In no time at all you will be tackling with ease the most difficult question on this subject.

ARITHMETIC: Starting with a quick review of principles, this volume presents all the special calculation methods used in business and industry which every practical man should know. Fundamental in all computations in engineering, both military and civilian. Essential methods for rapid calculation such as is needed in firing guns, setting lathes, etc. Systems of measurement and their computation required in machine work. Hundreds of other applications to technical work.

ALGEBRA: Starting with simple practical problems, this book shows you, step by step, how to apply algebraic methods to the most complex problems. Shows how to
(Continued on next page)

MATHEMATICS IS THE INDISPENSABLE FOUNDATION KNOWLEDGE FOR TODAY'S JOBS and the new technical Post-War Jobs

THOUSANDS of new jobs are waiting for trained men! Every industry is working at top capacity to meet the needs of our gigantic wartime program. Trained mechanics and technicians are in urgent demand. After the war, peacetime needs will be as great!

And in the best of these jobs, the jobs which offer the highest pay and the greatest assurance of steady employment, a knowledge of mathematics is required, because mathematics is the foundation of all technical work. Give yourself this basic preparation now by this quick, inexpensive home-study method—a complete mathematics course in five volumes.

MATHEMATICS for Self Study

by J. E. Thompson, B.S. in E.E., A.M., Dept. of Mathematics, Pratt Institute

(Continued from facing cover)

solve problems which are involved in all military and industrial work, relating to machines, engines, projectiles, ships, planes, etc. Logarithms and slide rule, and many other practical applications.

GEOMETRY: States clearly all needed facts about plane figures, circles, polygons, etc. Covers all the topics essential in drafting and engineering. It deals at length with angles, triangles, circles, and the many other geometric figures that are basic to engineering design. Sheet metal work, so important in airplane construction, is a direct application of these principles. So also is the laying out of ship hulls, which is the major activity in ship construction. The properties of circles and spheres explained in this volume also apply directly in navigation.

TRIGONOMETRY: This volume makes easy the principles of angles and triangles, shows you how to use tables that explain their functions. Practically every problem in machine work, land surveying, mechanics, astronomy, navigation and range finding is solved by methods of trigonometry. These methods are explained here in the most simple way with actual examples of calculations of height and distance as they are applied directly to the sighting of guns and the determination of the position of a ship at sea, the construction of buildings and fortifications, the cutting of gears, etc., etc. All necessary tables for making these computations are furnished in this book as they are in all the other volumes of this series.

CALCULUS: You will enjoy mastering calculus in this interesting new way and will find it will enable you to solve problems that can be solved in no other way. This branch of mathematics deals with rate problems. It is essential in computation involving objects moving with varying rates of speed. It also enables us to find the most efficient design for any kind of mechanism, engine, or moving vehicle. Typical problems included in this book are the calculation of the velocity with which a man supported by a parachute strikes the ground, the path of a bullet or shell, the work done by expanding gas or steam (which is applied directly in the design of rifles and cannon). These are but a few of the hundreds of subjects simplified and explained in this complete reading course in mathematics.

Free Examination Coupon

D. Van Nostrand Co., 250 Fourth Ave.,
New York 3, N. Y.

Send me MATHEMATICS FOR SELF STUDY in 5 volumes. Within 10 days I will either return the books or send you \$2.95 as first payment and \$2.00 per month for three months until the total price of \$8.95, plus a few cents postage, is paid.

(If you send \$8.95 payment in full with this order, we will pay postage. Same return privilege.)

A MICA MINE IN A LABORATORY

War shortages crop up in strange materials. Mica, for instance. Once seen principally in the windows of stoves, and in small boys' pockets, it is now used extensively as electrical insulation. In some war products, it is virtually indispensable: capacitors for radio, spark-plugs for airplane engines, insulators in electronic tubes.

With demand mounting, manufacturers were desperate.

A four-man technical mission flew to London to help ration the world's supply between the United States and Great Britain. The shortage was serious.

The War Production Board, convinced that much mica was classified too low when judged by appearance alone, asked Bell Telephone Laboratories to develop a new method of electrical tests. The Laboratories were able to do this quickly because

of their basic knowledge and experience in this field.

The new tests were made available to manufacturers in this country and abroad—the supply of usable mica was increased 60%—and a difficult situation relieved.

Skill to do this and other war jobs is at hand in Bell Laboratories because, year after year, the Laboratories have been at work for the Bell System.

BELL TELEPHONE LABORATORIES Exploring and inventing, devising and perfecting
for our Armed Forces at war and for continued improvements and economies in telephone service.

Where tire treads go swimming

No other rubber company makes tires this "odd" way . . .

a typical B. F. Goodrich improvement

B. F. Goodrich engineers put a "river in a factory" to make tires that wear longer. Soft, uncured rubber for tire treads—the part that rolls on the road—used to be squeezed out through an opening, like tooth paste out of a tube. The opening gives the right shape.

But the rubber always had to be worked, or "milled," a long time before it was soft enough to squeeze through—and milling always takes some of the strength from it. Even the largest and best tire manufacturers had long accepted this as an unavoidable loss of quality.

Then B. F. Goodrich men devel-

oped a machine that rolls the rubber through the opening instead of squeezing it through. It can handle firmer, tougher dough, with much less milling. Then they added the water conveyor shown above, to carry the tread away from the machine. A continuous stream of rubber flows into the water and floats along with it—carried without being distorted or strained while it is still new and hot.

No other tire is made today with this new kind of tread. It's one of the reasons why B. F. Goodrich synthetic-rubber tires are wearing so well today. Another, of course,

is the fact that B. F. Goodrich made and sold tires containing synthetic rubber three years ahead of every other manufacturer.

Continuous research at B. F. Goodrich has just one purpose—better tires—for cars, trucks, farm or special purposes. Because B. F. Goodrich all-synthetic tires are backed by this policy of constant improvement, they give you extra wear, extra safety, extra value. The B. F. Goodrich Co., Akron, Ohio.

In war or peace

**SURE YOU'LL
BE PROUD OF IT—**

There's a *Ford* in your future!

It's only human nature to be proud of things you like. And when your new Ford car arrives—some day not too far away—you'll surely want the world to know it's yours!

... Your friends will call it "handsome". For your new Ford will have smart and youthful styling. It will be a big car

—roomy, sturdy, and rich appearing, both inside and out. . . . Naturally, this new car will offer the traditional Ford economy and reliability. And it will reflect all the skilled craftsmanship and experience which Ford has gained through more than 40 years.

. . . Yes, we're sure to be ready

when the time comes. Our production plans will be all set. And when we get the "go-ahead", we'll start to make "the Ford in your future."

FORD MOTOR COMPANY

what will *YOU* be doing one year from *TODAY*

YOU'RE too smart to stay in the same old job rut! You know that you have one life—that's all. So you've thought about *doing something* that would advance you in your work, increase your income.

The time to get started is now. And you can take the first step toward Personal Success this very minute! Just look over the coupon below and mark the I. C. S. Course in your field of interest. Then mail it — today!

We'll send you complete information on the International Correspondence Schools, and how they can give you the sound, practical training you need to get ahead faster. Cost is low, texts are easy to understand, and every student gets personal service. The time to "take steps" is RIGHT NOW!

FORTY-FIVE YEARS AGO, a university professor blew a hole in a heavy steel safe with a tiny charge of dynamite. His amazing discovery, reported at the time in Popular Science Monthly, is the secret of the destructive power of the bazooka and other modern weapons. See page 65.

How *you* can provide that NEST EGG for a rainy day...

the quick, easy way

Apply to protect YOUR War Bonds and other savings by creating a rainy-day nest egg with an investment of only a few cents a day in The Commercial Travelers of Utica.

Share with our 210,000 carefully chosen members the risk of accident, sickness and hospitalization the safe, economical way . . . DIRECT, at cost.

You Pay Only Your Share of the relatively low cost of protecting preferred risks like yourself if you qualify for membership as a man between 18 and 55, engaged in almost any "white collar" occupation.

Send No Money Now! As little as \$2 pays until late next June . . . depending upon the plan. Succeeding quarterly charges as low as \$2.50 for accident only—moderately higher for health and hospitalization.

This insurance covers you night and day, at home, on trips, at work, at play. No red tape! No jokers or trick clauses! We are licensed by the Insurance Departments of the State of New York and the Dominion of Canada.

For a Few Cents a Day

YOU GET

\$2,600.00—\$25.00 weekly, payable every 30 days for as many as 104 weeks for loss of time through injury by accidental means . . . *as much as \$2,600.00 for any one accident.* \$12.50 weekly for partial disability for 26 weeks.

\$5,000.00 for loss of life, limbs or sight caused by violent and accidental means.

Double Accident protection also available.

\$1,300.00 — \$25.00 weekly, payable every 30 days for as many as 52 weeks . . . *up to \$1,300.00 for any one confining sickness . . . \$12.50 weekly for non-confining sickness for as many as 26 weeks.*

\$ 290.00—And in addition . . . you get up to \$ 290.00 for hospital room or nurse in your home, surgery, X-ray, operating room, anaesthesia and laboratory fee, paid direct to you regardless of other insurance held.

NO SOLICITORS WILL CALL

Coming Next Month

WHAT WE'RE UP AGAINST. Following up recent articles on Japanese air and seapower, Popular Science presents a thorough study of the land weapons of our enemies in the Pacific. Tanks, artillery, small arms, and ammunition all come in for appraisal and comparison with our own comparable weapons. The war news will mean more to you after you read this illuminating article.

COPPER ranks next to steel as the most-used metal in peacetime. In war, it is a vital necessity. How did America meet the pyramiding demand for copper in this global war? Hal Borland describes the methods of mining and refining that supplied our needs for electrical wiring, alloys, and shell cases. You'll be thrilled by this story of another wartime triumph of U. S. science and industry.

WANT TO BUY an Army field-telephone set? That's just one of countless items the Government will offer at bargain-counter prices in disposing of surplus war stocks. Popular Science is offering \$200 in prizes for the best letters from readers telling what they want to buy from this immense stock—and what they'll do with it. Watch for full details of this contest, with lists of merchandise.

LIGHT is the paintbrush with which the photographer gets his effects. Camera enthusiasts now have at their disposal a wide choice of artificial illumination, but they sometimes fail to make the best possible use of it. Konrad Cramer gives practical advice on lighting setups and tells how to get the most out of these magic aids to lenscraft.

THE PLANES YOU'LL FLY. It was exciting to read the results of the Popular Science contest "The Plane You'd Like to Own." But even more important than finding out who won is the analysis of the entries to see what the private flyers of tomorrow are going to demand in their postwar planes. A careful breakdown of the entries reveals the percentages of preference on all features dealing with comfort, safety, and performance.

NAVY TUGS are playing a heroic though unsung role in the war at sea. Model builders will welcome the chance to reproduce one of them in miniature, in a waterline model scaled to $\frac{1}{8}$ inch to the foot. Easy to build from the detailed plans and instructions, the model represents one of the 65-foot towboats that lend a helping hand to our fighting ships in home waters.

PEPSI-COLA

E. SEGAR

AN UNUSUAL TRUE STORY

**It May Have a Tip
for You**

"No, I can't talk to you. I am not interested in a correspondence course in Accounting and besides, I have a bowling date for tonight."

That's what our representative heard one day two years ago from a bright young man, high school graduate and bookkeeper for two years in a western city. Let's call him Jim, although that isn't his real name.

Just a month or so before, this same LaSalle representative had enrolled for the very same training another young man (let's call him Bert) recently arrived from Europe and then working as an office boy in the same town at \$15 a week. Bert worked enthusiastically, aggressively in his spare time on his study.

A year later our representative was asked, as they so often are, to recommend a successor to the chief accountant of Jim's company, a successor to the man under whom Jim worked. He recommended Bert and Bert was hired—as Jim's boss and at a salary considerably larger than Jim received. Four months later, Bert was made comptroller and given another salary increase.

A month later, Jim enrolled for the training which he had turned down a year before and he has since had a salary raise. He had been badly disappointed but he saw the point. He decided that he would not make the same mistake twice.

An Unusual Story—Yes

It doesn't often happen exactly as it did in this case. But in essence it does happen far more frequently than you suspect.

For business, when it has an opening, looks first to its own present employees to see who is ready and prepared for the job. But if, as so often happens, it finds no one, then it goes outside for the person it wants.

Don't blame the employer. Nine times out of ten, he would prefer a man or woman already experienced and familiar with company policies and methods. But he knows that long, loyal service in the job below may not be enough—he must have trained ability for the position.

That's why business watches its employees so eagerly—to see who is ambitiously and systematically preparing for promotion. We hear it over and over again—this note of gratitude when we tell an employer (as we do on request of any student) that some employee of his is training with us for better service to him.

Can It Happen to YOU?

There's only one way to be certain it cannot. That is to prepare yourself for the jobs ahead—for the place you want, either with your present company or some other. And quick action is particularly important in this critical period with so many changes and opportunities.

Mailing the coupon below can be your first step. It will bring to you—without cost or obligation—a free 48-page booklet about the business field of your choice, telling of the opportunities and requirements and describing our proven and low cost training for success in that field. Why not take that first step now?

Our 21st Year of Training Men
for Success in Radio

Good Jobs Like These Go To Men I Train

Farmer Made \$600 Extra—About six months after I graduated I started making extra money in radio. I am a farmer and just work on radio when the bad and stormy days. I got brought me a job at \$600 per month. —BENNIE L. WENDUS, RFD 2, Alexander, Iowa.

\$80 a Week From Own Shop—Am making over \$80 a week profit from my own shop. Have son here after graduation working for me. I like to hire A.R.T. men because they know radio. —MORRISAN MILLER, Hertron, Neb.

Radio Repair Shop for Sears Roebuck—I was a barber and not working steady. After graduation I took the A.R.T. Course I came with Sears Roebuck and now run their radio repair shop here in a steady income. —WILFRIDAN P. PERRY, RR 1, Box 1123, Davenport, Iowa.

\$80 a Month in Spare Time—I have a spare time radio and I make a good deal of my own which has been very profitable due to the efficient training I received from your Course. Last year I averaged over \$80 a month. —FRED H. GRIFFIE, Route 3, Newville, Pa.

Transmitter Network Engineer—I began in S.R.I. training while 15 years old and at my high school. Am now transmitter engineer here for one of the big networks. —THEODORE CAMPBELL, Johnstown, Pa.

Many Opportunities Ahead for Trained Radio Technicians and Operators

The future looks bright for capable, well-trained Radio Technicians and Operators. The Radio Repair Business is booming. Profits are large and prospects are bright. Think of the new boom in Radio Sales and Servicing that's coming when new Radios are again available—when Frequency Modulation and Electronics can be promoted—when Television starts its new era of expansion!

Broadcasting Stations, Aviation Radio, Police Radio, Loudspeaker Systems, Radio Manufacturing all give good jobs to trained Radio men—and most of these fields have a big backlog of business that built up because of the war, plus opportunities to expand into new fields opened by wartime developments. You may never see a time again when it will be so easy to get a start in Radio!

Many Beginners Soon Make \$5, \$10, a Week EXTRA in Spare Time

The day you enroll for my Course I start sending you EXTRA MONEY JOB SHEETS that help show how to make EXTRA money fixing Radios in spare time while still learning. I send you SIX big kits of Radio parts as part of my Course. You LEARN Radio fundamentals from my illustrated, easy-to-grasp lessons—PRACTICE what you learn by building real Radio Circuits—and use your knowledge to make EXTRA money!

Mail Coupon for FREE Lesson and Book

The opportunity now offered beginners to get started in Radio may never be repeated. So take the first step at once. Get my Lesson and 64-page illustrated book FREE. No obligation—no salesman will call. Just mail Coupon in an envelope or pasted on a penny postal—**J. E. SMITH, President, Dept. 58P3, National Radio Institute, Pioneer Home Study Radio School, Washington 9, D. C.**

You Build These and Other Radio Circuits with 6 Big Kits I Send

MEASURING IN THE SPOTLIGHT. You can build this kit and use it to measure voltage, current, resistance, frequency, etc., in any circuit. It is also used for many other purposes.

SUPER HETERODYNE. This is a super-regenerative receiver. It can receive short wave bands, and has a built-in speaker. It can also be connected to a vacuum tube power amplifier.

A.M. SIGNAL GENERATOR. Build it yourself! Practice what you learn about signals for test and experimental purposes. Great value this practical.

THE GREATEST POWER ON EARTH!

The Magic of Mind

WERE the great personages of the past victims of a stupendous hoax? Could such eminent men of the ancient world as Socrates, Pericles, and Alexander the Great have been deluded and cast under the spell of witchcraft—or did the oracles whom they consulted actually possess a mysterious faculty of foresight? That the human mind can truly exert an influence over things and conditions was not a credulous belief of the ancients, but a known and demonstrable fact to them. That there exists a wealth of infinite knowledge just beyond the border of our daily thoughts, which can be aroused and commanded at will, was not a fantasy of these sages of antiquity, but a dependable aid to which they turned in time of need.

It is time you realized that the rites, rituals and practices of the ancients were not superstitions, but subterfuges to conceal the marvelous workings of natural law from those who would have misused them. Telepathy, projection of thought, the materializing of ideas into helpful realities, are no longer thought by intelligent persons to be impossible practices, but instead, demonstrable sciences, by which a greater life of happiness may be had.

One of America's foremost psychologists and university instructors, says of his experiments with thought transference and the powers of mind—"The successes were much too numerous to be merely

lucky hits and one can see no way for guessing to have accounted for the results." Have you that open-minded attitude of today which warrants a clear, positive revelation of the facts of mind which intolerance and bigotry have suppressed for years? Advance with the times; learn the truth about your inherited powers.

Let this free book explain

The Rosicrucians (NOT a religious organization) have been leaders in introducing the ancient wisdom of mental phenomena. Established throughout the world for centuries, they have for ages expounded these truths to those thinking men and women who sought to make the utmost of their natural faculties. Use the coupon below—avail yourself of a pleasing book of interesting information which explains how you may acquire this most unusual and helpful knowledge.

The ROSICRUCIANS (AMORC)

Will You Let Me PROVE I Can Make YOU a New Man?

LET ME START SHOWING YOU RESULTS LIKE THESE

Here's What Only 15 Minutes a Day Can Do For You

I DON'T care how old or young you are, or how exhausted of your present physical condition you may be. If you can simply raise your arm and flex it I can add **BUILD** **MUSCLE** to your biceps just on each arm in double-quick time. Only 15 minutes a day—right in your own home. In all this time I ask of you! And that's no cost if I do.

I will broaden your shoulders, strengthen your back, develop your whole muscular system **INSIDE** and **OUTSIDE**. I can add inches to your chest, give you a clas-like grip, make those legs of yours to be and powerful. I can shoot new strength into your old back bone, even in those inner organs, help you earn your bread in full of pep. Your head and red blood cells that don't feel there's even a single pound left for weakness and that lazy feeling! Before I get through with you I'll have your whole frame measured to a nice, new beautiful suit of muscle!

What's My Secret?

"**Dynamic Tension!**" That's the ticket! The central natural method that I myself developed to change my body from the scrawny, skinny-cheated weakling I was at 17 to my present super-man physique. Thousands of other fellows are becoming marvelous physical specimens my way. I give you no gadgets or contraptions to fool

with. When you have learned to develop your strength through **Dynamic Tension** you can laugh at all these muscle masters. You simply utilize the DYNAMIC muscle power in your own God-given body, watch it increase and multiply double quick into real solid MUSCLE.

My method—"Dynamic Tension"—is I tell the trick for you. No theory, every exercise is practical. And man, so easy! Spend only 15 minutes a day in your own home. From the very start you'll be using my method of **Dynamic Tension**, almost unconsciously every minute of the day: walking, bending over, etc. In **BUILD MUSCLE** and **VITALITY**.

FREE BOOK "Everlasting Health and Strength"

In it I talk to you in straight-from-the-shoulder language. Packed with inspirational pictures of myself and pupils, fellows who became NEW MEN in strength my way. Let me show you what I helped THEM do. See what I can do for YOU! For a real thrill, send for this book today. AT ONE CHARLES ATLAS, Dept. 12, 115 East 23rd St., New York 10, N.Y.

No SIR! - ATLAS
Makes Muscles Grow
Fast!

CHARLES ATLAS

Awarded the title of "The World's Most Perfectly Developed Man" in international contests in competition with all men who would consent to appear against him.

This is a recent photo of Charles Atlas showing how he looks today. This is not a studio picture but an unposed, unguarded snapshot.

CHARLES ATLAS, Dept. 12

115 East 23rd St., New York 10, N.Y.

I want the proof that your system of "Dynamic Tension" will help make a New Man of me—give me a healthy, bushy body and big muscular development. Send me your free book "Everlasting Health and Strength."

Patent Guide for Inventors

PATENT GUIDE

FOR THE INVENTOR
CLARENCE A. O'BRIEN
& HARVEY B. JACOBSON
REGISTERED PATENT ATTORNEYS
WASHINGTON, D.C.

**48
PAGES
Over 150
Mechanical
Movements**

LATEST FACTS ON INVENTIONS

Is your invention something for the home, the farm, the factory, the store? Would you like to know whether anything like it has ever been invented and if not, how to protect your invention? Our new 48 page book "Patent Guide for the Inventor" will show you how to proceed with your invention. You'll get a good idea of whether you have something or not. Would you like to know how you may judge the marketability of your invention? This book gives you several important tests prepared by authorities. Read of the experiences of Bell Edison, Westinghouse and other outstanding successful inventors who patented and thereby protected their inventions. This book not only tells you how to obtain a patent, it also explains the steps that must be taken afterward to promote the success of your invention. MAIL THE COUPON TODAY to Clarence A. O'Brien & Harvey B. Jacobson, Registered Patent Attorneys, 52 B Adams Building, Washington 4, D.C.

**CLARENCE A. O'BRIEN
& HARVEY B. JACOBSON**
REGISTERED PATENT ATTORNEYS

INVENTORS

NOW Is the Time to PATENT and SELL Your Invention

Now, more than ever before, is the right time to patent your invention. Why? Because manufacturers everywhere presently engaged in war production are looking ahead to the future by buying up patent rights now, so they will have new and attractive items to make and sell for civilian consumption as soon as the war is over. This is what happened during and after the last war. Hence, the smart thing for you to do is to look ahead to the future too. Protect your invention and yourself by applying for a patent now.

Patent Guide Shows What To Do

Our "Patent Guide for the Inventor" answers many important questions concerning Patents that inventors constantly ask. It tells what facts, details, drawings, sketches, etc., are necessary to apply for a Patent; how to protect your invention through dated and witnessed disclosure, how to do this AT ONCE to safeguard your rights; how Patent Office Records can be checked to determine whether the invention is probably patentable before filing fees need be paid; discusses costs involved and a practical way these can be paid as the application progresses. It tells how some inventors secured financial backing, how many simple inventions have proved large commercial successes; how Patents covering improvements also can be profitably utilized and marketed; tells countless other facts of interest.

Why You Need Expert Assistance

The Patent Laws were enacted for your benefit—to give you protection for the features of your invention which are Patentable. But these features must be legally and concisely set forth in the form of "claims." This phase of the procedure is so complex that the Patent Office advises the Inventor to engage a competent Registered Patent Attorney. We maintain a large staff—carefully trained registered patent attorneys—expert draftsmen—experienced searchers—to serve you. We have been serving inventors for more than 20 years.

Take First Step Now

With the Patent Guide you will receive also Free a "Record of Invention" form which will enable you at once to establish the date of your invention, before you file your Patent application. This step costs you nothing yet may be vital to your success. Remember—in Patent Matters, ACTION is IMPORTANT. Delay can be costly. Mail the coupon in an envelope, or paste it on a penny postcard NOW.

Prepare for a BRILLIANT PEACE-TIME CAREER

Learn AIRCRAFT DESIGNING and ENGINEERING

Sensational Peace Time Developments
of New Planes Mean
New and Greater Opportunities

JET PROPULSION

Get Training Direct
From The Industry

R.A.I. training is based on both scientific theory and practical experience. From R.A.I. you learn the fascinating facts of aerodynamic science, plus the wisdom gained by Ryan experts in many years of practical application of those facts. For R.A.I. is affiliated with the famous Ryan School of Aeronautics, where thousands of both civilian and fighter pilots have been trained, and with the Ryan Aeronautical Company, pioneer manufacturer of many famous airplanes. If you want the best training to prepare yourself for the best aviation jobs, WRITE TO RYAN TODAY!

Complete Aeronautical
Drafting Course
At NO EXTRA COST

You get this complete, professional drafting equipment set without additional charge. There is nothing else to buy—no extra costs to bother you as you progress toward your valuable diploma—your ticket to a new, exciting, high paid career.

RYAN'S New Home Study Course Trains You in Spare Time

New planes require new plans—plans that you may help perfect. The thousands of new airliners, cargo planes, pleasure craft, sporting planes, can't be manufactured until designs and plans are prepared. There'll be a huge need for trained designers and draftsmen to turn out the tons of blueprints required.

YOUR PLACE IN THE "AGE OF FLIGHT"

It is agreed by experts that the aircraft industry will be one of the largest, most progressive and fastest growing of all future industries. Prepare now for one of these exciting, well-paying positions through home study training—the RYAN WAY. Previous training is unnecessary. You learn at home in your spare time, under individualized supervision. Lessons are so easy and interesting that many earn the coveted Ryan diploma far ahead of schedule.

DO THIS—THEN JUDGE FOR YOURSELF

You owe it to yourself to see that the study course on which you spend your time is the finest—the most practical. So use this coupon—NOW! There is no obligation—it'll take but a minute—and it may be your passport to a successful career in aviation. To save time, send it Air Mail.

Read What
These R.A.I.-Trained
Men Say:

R.A.I. Training Brings
Better Job and Rates in Pay

"A. The time I dedicated for your course I was getting in a much better attitude. However in October I got transferred into the Tool Design Department. Mr. Dyer has been transferred and I hope to realize greater profits in the future. Niagara Falls, N.Y."

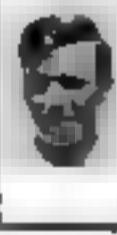

Says R.A.I. Course Superior to All
"I believe your course to be far superior to all others in the nature that has come to my attention. This is my opinion after I've studied several courses and to me, I have always felt untrained R.A.I. students to be superior to all others in the field." E. L. Johnson, Los Angeles, California.

Gets Job Before Graduating

After 6 months of months of study I called on one of the oldest aircraft manufacturing firms on the west coast who in turn employed me as a draftsman. This shows how R.A.I. ranks with the aircraft industry. I would like to thank all R.A.I. students assistance has been of invaluable value to me. William A. Headlee, Jr. San Diego, California.

New Horizons
of Opportunity

This FREE BOOK Helps INVENTORS TO PROTECT THEIR INVENTIONS

MODERN BUSINESS WANTS INVENTIONS

Practical and novel inventions are in big demand today. The opportunity for quick money is enticing. Sales sources are many if your invention has merit. But, be sure—before you place your device in strange hands—that it is fully protected. A United States Patent gives you this protection. *The first step toward inventive success always is—and always has been—the application for a U. S. Patent. There is no other way to protect your invention in accordance with the laws of this country.*

MAKE THIS RECORD NOW! If you have an invention, and wish to secure it for the future, act at once. Have it dated now and recorded in our office. We will send you this FREE Invention Record Form for the purpose. Fill out the Invention Record Form fully describing the nature of your invention. Make a sketch of its main features. Mail it to us and we will record the date it was received in our office. The earlier the date the better your chance of combating rival inventors who may lay claim to your idea later. *Don't delay a single minute in taking this important step. Your whole future may depend upon it. Mail the coupon for our FREE Invention Record Blank and New FREE Book Today!*

HOW WE SERVE YOU AS REGISTERED PATENT ATTORNEYS The U. S. Patent Office strongly recommends—unless the inventor is familiar with such matters—that he employ the services of a Registered Patent Attorney in the preparation of his Patent Application. We are Registered Patent Attorneys fully qualified to represent you at the Patent Office. We have had long experience in studying hundreds of types of inventions. This gives us the ability to judge your invention and to describe it accurately and convincingly in technical language. It gives us the perception to center arguments upon those details of your invention which, in our judgment, will be looked upon most favorably by the Patent Office Examiner.

Mail the coupon today for our new FREE Book, "How to Protect, Finance and Sell Your Invention," and our FREE Invention Record Form—maybe this step will pave the way to future security for you and your family. Act Today!

We paint no glowing road to fortune—but if you have an invention . . . if it serves a definite new need . . . if the public accepts it—we can tell you it may provide the security and benefits you are seeking.

Know How Successful Inventors Protect and Sell Their Inventions

Our new FREE Book is the latest volume on Inventions and Patents off the press. It is a book every inventor should have. Mail the coupon today for our book "How to Protect, Finance and Sell Your Invention" and learn these important facts:

How to know if there is a prior U. S. patent on your invention
How to save steps in getting patent action.
How we prepare your application for presentation to the Patent Office
How you may patent an improvement on something in use now.
How to obtain funds to patent and promote your invention.
How to find a buyer or backer for your invention.
How to protect yourself in making royalty agreements.

These and many other inventive facts you'll learn by reading our new FREE Book, "How to Protect, Finance and Sell Your Invention."

IMAGINE! MUSIC LESSONS

for less than 7¢ a day

Thousands have learned to play this quick, easy short-cut way, right at home—**AND YOU CAN TOO!**

PLAYS FROM START
I can play my favorite instrument, even though I'm only at the beginning. It's such a thrill to learn to play old tunes by note almost from the start. First printed instructions tell you how to play a tune. Next a picture shows you how. Then you play it yourself and hear how it sounds. You go from simple tunes to more advanced pieces. And sooner than you ever dared I hope you're thrilled to find that you can play almost any popular number by note.

PLAYS ON RADIO
A friend said I can't keep from telling you I am a realty of my course. I have a good position playing from KTHB every morning.
—J. S. Heuer, Okla.

U. S. guard for learning first this exciting easy-start "Print and Picture" way. Instead of hours, even days, you can learn to play old tunes by note almost from the start. First printed instructions tell you how to play a tune. Next a picture shows you how. Then you play it yourself and hear how it sounds. You go from simple tunes to more advanced pieces. And sooner than you ever dared I hope you're thrilled to find that you can play almost any popular number by note.

And just think! You can study any instrument you like for less than 7¢ a day. That includes valuable

short-course printed by
structured degrees and
in U. S. School of Music
Service.

If you really want to learn this new, easy-to-learn way, you can't afford to miss out on our Free Illustrated Booklet and Print and Picture Sample. See how easy it is to learn this modern, short-cut money-saving way. Check instrument you want to play. Mail coupon now! U. S. School of Music, 62 Brunswick Bldg., New York 10, N. Y. AUDELS REFRIGERATION & AIR CONDITIONING GUIDE . . . \$4

New from Cover to Cover—1280 Pages. Fully illustrated covering basic principles, servicing, operation & repair of household, commercial & industrial refrigeration & air conditioning. A gold mine of essential important facts for engineers, servicemen, users.

AUDELS CARPENTERS & BUILDERS GUIDES—4 Vols. \$6

A practical illustrated trade assistant to modern construction for carpenters, joiners, builders, masons and all woodworkers. 4 Vols., 1800 pages, 2700 illustrations, flexible covers. Pocket size. Each volume sold separately \$1.50 a vol.

AUDELS AUTOMOBILE GUIDE . . . \$4

A practical, quick ready reference book for auto mechanics, service men, operators & owners. Explains theory, construction & use in use of modern minor cars, trucks, buses & auto-type Diesel engines. 1540 pages, fully illustrated, 55 chapters. Indexed. A standard book for mechanics. New fluid drive covered.

AUDELS DIESEL ENGINE MANUAL \$2

A practical, concise treatise with questions and answers on the theory, operation and maintenance of modern Diesel engines, including General Motors 2 cycle Diesel. 224 pages. Fully illustrated, pocket size. All details plainly brought out. This book is of extreme value to engineers, operators & students.

AUDELS WIRING DIAGRAMS . . . \$1

240 Pages. Illustrated. Gives practical facts on wiring of electrical apparatus. It shows clearly how to wire apparatus for power, heat, light, etc. Each diagram is complete & self explanatory. Highly Illustrated Pocket Companion.

AUDELS PLUMBERS & STEAMFITTERS GUIDES—4 Vols. \$6

A Practical Trade Assistant & Ready Reference. Explains in plain language & by clear illustrations, diagrams, charts, graphs, etc., gives practical rules of modern plumbing practice, including Marine Pipe Fitting & Air Conditioning. 4 Vols.—1450 Pages—412 Diagrams. Pocket size. Each Vol. Sold Separately \$1.50 a Vol.

AUDELS SHEETMETAL WORKERS HANDY BOOK . . . \$1

Short, sharp & to the point on fundamentals of Sheet Metal Work. 100 pages. Illustrated. 11 sections. Every written detail & important facts, figures, pointers in everyday language. Ref. Index.

AUDELS SHEETMETAL PATTERN LAYOUTS . . . \$4

Developed by Experts for Sheet Metal Workers' Layout Men & Mechanics. A Practical Handybook in 10 Sections, size 7 x 10 x 2—1150 Pages, 400 Illustrations—4001 Keys. Fully indexed for ready reference in answering your layout problems. Covers all phases of sheet metal work including Pattern Cutting, Pattern Development & Shop Procedure.

AUDELS ANSWERS ON BLUE PRINT READING . . . \$2

For Engineers & Builders. Covers all types of blue print reading including ship & airplane. 314 pages, fully illustrated.

AUDELS NEW MACHINIST & TOOLMAKERS HANDY BOOK . . . \$4

Covers machine shop practice in all its branches. 5 practical books in 1. New from cover to cover. Tells how to set up & operate lathes, screw and nutting machines, shape & drill presses and all other machine tools. 1000 pages, fully illustrated. 7 x 10 x 2. Indexed. 1—Machinist's Handbook. 2—Practical Blue Print Reading & How to Draw. 3—Answers & Mathematics for Machinists. 4—Shop Practice. 5—How to Use the Rule. 89 chapters. Easy to read and understand. A shop companion that answers your questions.

AUDELS MATHEMATICS & CALCULATIONS FOR MECHANICS \$2

Manual for home study or reference. 700 pages. 3x6. This book of math is from beginning to end to figure correctly. Easy, correct methods covering a complete subject. Illus. & Indexed.

AUDELS HANDY BOOK OF PRACTICAL ELECTRICITY . . . \$4

For all electrical engineers, electricians & all electrical workers. 1,100 pages, 2x8. Fully covers important electrical information in handy form—including Star and Winding, Radio Principles, Welding, Indexed. & key to a practical understanding of electricity.

AUDELS RADIOMAN'S GUIDE . . . \$4

A key to the practical understanding of radio. On the Frequency Modulation, Television, etc. Aircraft & Marine Radio. For radio engineers, technicians, amateurs. 772 pages, 1000 illustrations & Diagrams, Photos. Review Questions & Answers, Reference Index. Authentic, clear, concise.

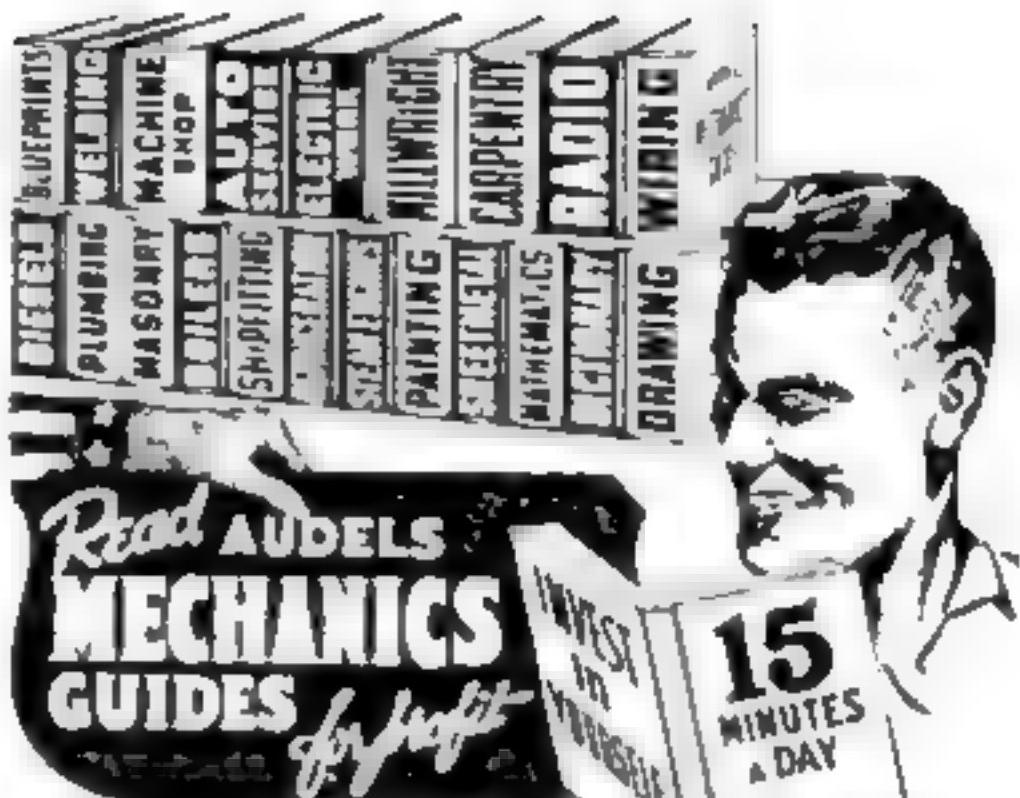

AUDELS ELECTRONIC DEVICES . . . \$2

Tells What You Want to Know About Electric Eyes. Easily Understood. Covers photoelectric cells & their applications. Amplifiers, Illumination, frequencies, voltage, phasor, tubes, Ohm's Law, Wiring diagrams, etc.

AUDELS WELDERS GUIDE . . . \$1

A concise practical text on operation & maintenance of all welding methods for all mechanics. Over 400 pages, illustrated. Covers all methods of electric and acetylene welding including airplane work.

AUDEL, Publishers, 49 W. 23 St., N.Y. 10

SPRAYBERRY RADIO TRAINING

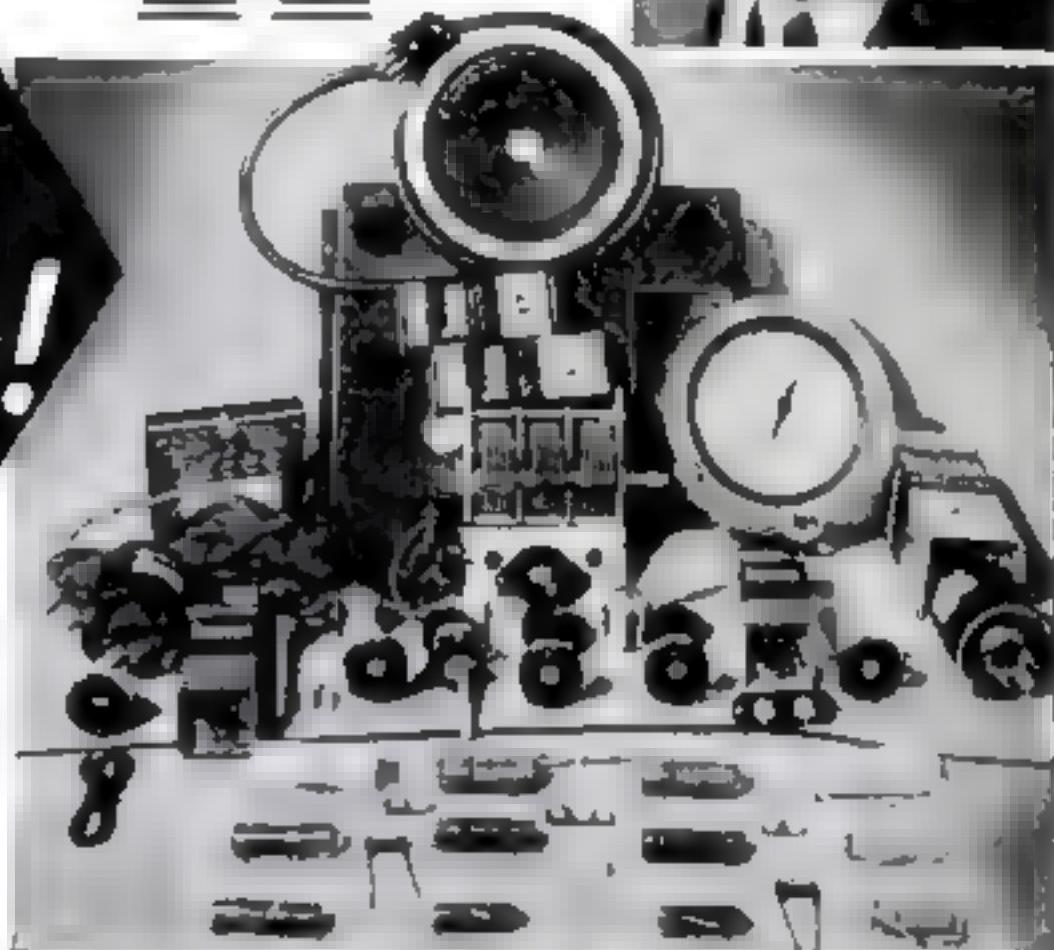

Gives you Both

TECHNICAL KNOWLEDGE

SKILLED HANDS

FULL RADIO SET
SUPPLIED FOR
SHOP PRACTICE!

HERE'S THE ONE PRACTICAL WAY TO TRAIN FOR BIG EARNINGS AHEAD IN RADIO-ELECTRONICS & TELEVISION

The offer I make you here is the opportunity of a lifetime. It's your big chance to get ready for a wonderful future in the swiftly expanding field of Radio-Electronics INCLUDING Radio, Television, Frequency Modulation and Industrial Electronics. Be wise! NOW is the time to start. No previous experience is necessary. The Sprayberry Course starts right at the beginning of Radio. You can't get lost. It gets the various subjects across in such a clear, simple way that you understand and remember.

I'll Show You a New, Fast Way to Test Radio Sets Without Mfg. Equipment

The very same Radio Parts I supply with your course for gaining pre-experience in Radio Repair work may be adapted through an exclusive Sprayberry wiring procedure to serve for complete, fast, accurate Radio Receiver trouble-shooting. Thus under Sprayberry methods you do not have one cent of outlay for manufactured Test Equipment which is not only expensive but scarce.

Prepares You for a Business of Your Own or Good Radio Jobs... Civilian or Military.
My training will give you the broad, fundamental principles so necessary as a background no matter which branch of Radio you wish to specialize in. I make it easy for you to learn Radio Set Repair and Installation Work. I teach you how to install and repair Electronic Equipment. If you enter the Army, Navy or Marines, my training will help you win higher rating and better pay.

JUST OUT! FREE!

"How to Read Radio Diagrams and Symbols"

A valuable new book which explains in simple English how to read and understand any Radio Set Diagram. Provides the quick key to analyzing any Radio circuit. Includes translations of all Radio symbols. Send for this FREE book now and along with it I will send you another big FREE book describing my Radio-Electronic training.

(Mail in plain envelope or paste on penny postcard)

Flanked by a copy of P.S.M. telling about the \$1,000 postwar-plane contest, Don Fotheringham works on sketches for design that brought home the bacon

Readers Say:

Something More About Fotheringham from a Buddy in the Marines

HERE are some more details about Pfc. Don L. Fotheringham, of the U.S. Marine Corps, from a fellow leatherneck:

The winner of first prize (nonprofessional class) in the POPULAR SCIENCE contest "The Plane You'd Like to Own" is all of 17 years old, and a veteran member of the fighting Fourth Marine Division. Born February 19, 1927, in Salt Lake City, Utah, he had to bamboozle his way into the Marine Corps. This was when he was 16 and a student at the Idaho Falls, Idaho, junior high school.

First, he showed up at his local draft board, told authorities there that he had just turned 18, and registered. Measuring close to five feet 10 inches, and tipping the beam at 182, he had little difficulty. Next, he headed for the nearest Marine recruiting office, pulled out a brand-new draft registration card, and said, "I want to enlist." He was accepted.

Then came the toughest job: getting his parents to see eye-to-eye with him. But he jumped that hurdle and was sent to the

"That's kid stuff; I'm a Marine now."

And out here nobody will deny it.

Shortly after the Marshall Islands campaign, his true age and the details of his enlistment were discovered. The Fourth Marine Division, however, had important business to attend to in the Marianas. So Fotheringham was left behind at a rear base pending investigation. The matter was cleared up to everyone's satisfaction, and the Marine again joined his buddies in the Fourth.

According to his contest entry, his occupation is "kicking hell out of the Japs so that I can return home to the following type of plane."—T/Sgt. Martin Kivel, USMC, somewhere in the Pacific.

They Could Have Done It Equally Well with a Lion

I FIND the math problems in this department most interesting. Here is one I'd like to pass along: Two hunters shot a deer. Determined to find out what the deer weighed, and not having a scale with them, they proceeded as follows: Knowing that their own weights were 120 and 180 pounds respectively, they placed a fence rail across a log so that when one of them sat on each end of the rail, they balanced each other. Then, by exchanging places, they found that they again balanced when the 120-pound hunter held the deer. What was the animal's weight?—R. E., Milwaukee, Wis.

You can use.

**YOU CAN BUILD 133
FASCINATING EXPERIMENTS.**

You get both radio parts and "Learn-by-Seeing" movies to help you grasp the fundamentals of Radio-Electronics faster . . . easier . . . from DeForest's. Send for DeForest's big, free book "**VICTORY FOR YOU!**" Learn how—at home—in your spare time—you get real Radio experience with three many Radio parts and sub-assemblies. DeForest's practical equipment system (as pictured above) saves time . . . speeds experiments. You quickly build Radio Receiving Circuits that work . . . a device for Light Beam Transmission, Electric Eye Circuits, a Radio Telephone, and scores of other fascinating projects. Learning Radio at home is practical, effective, and so interesting—with DeForest's "Home Laboratory."

YOU ALSO USE "LEARN-BY-SEEING" MOVIES

Think of the help you can get from the use of this genuine DeVRY Motion Picture Projector and exciting Radio TRAINING FILMS! You'll surely be surprised how much faster easier longer movies can help you understand the fundamentals of Radio. SEE the principles of what you're learning up-to-date ANIMATED! Peer into moving parts whenever needed from the con-

RADIO

三月三十日

You build and operate these interesting Radio-Electronic circuits in your own home:
 3-Tube Superheterodyne Radio Receiver - Long-Wave Aerial Band Radio Receiver - Short-Wave Radio Receiver - Radio Telephone - Wireless Microphone - Photo Electric Cell Control - Vacuum Tube Voltmeter - Public Address System - Hearing Aid Amplifier - Intercommunicating System - Radio Code Transmitter - Electron Coupled Oscillator - Tuned Radio Frequency Receiver and many other projects.

You get the big Berlin home-training advantage of movies—rehearsals from DEUTSCHE'S. See act now! Mail the coupon today!

YOU GET "ALL THREE" WITH B-FOREST'S

Where else can you get such a combination of proved major training facilities as: (1) 20 quarter, loose leaf books prepared under the supervision of Dr. Lee De Forest often called the "Father of Radio," (2) The use of "Learn by the Job" home training films and a genuine 3000-Word Dictionary and its opposite side (3) The use of many studio parts to build 122 practical radio experiments in leisure time.

YOU BE THE JUDGE

See how De Forest's Training has helped many to good pay jobs in Radio-Electronics—others in preferred military classifications at Utilities to interesting profitable businesses of their own. See how you can prepare for a bright future now—in your spare time all alone, then get started in Radio-Electronics with the help of De Forest's effective TRAINING COURSES.

It is expected to be the first of the new year.

**DeFOREST'S TRAINING INCLUDES
INSTRUCTION IN MOTION PICTURE,
SOUND EQUIPMENT, FM RADIO
AND TELEVISION**

One-Armed Man Gives Tip on Tying Shoelaces

THIRTY years ago, at the age of nine, I lost my right hand in a dynamite explosion. Since then I have learned a lot of little tricks to get along without having to ask help from those around me.

Here's a suggestion that may be helpful to some of the brave boys who have lost a hand in the war: Lacing and tying shoes is no problem for a normal person, but it can be troublesome to a one-armed man. I cut off one end of my shoelace and make a double knot at this end. Through one of the two lowest eyelets I push the tip end up and draw it taut, so it is anchored by the knot. Then I thread the lace, as shown in the illustration, until it comes out the last eyelet, when it's a simple matter to make it fast by passing it through the eyelet again, and pulling it taut. It is easy to undo it, too, but it will hold securely until it is time to remove the shoe.—P. C., Montreal, Canada.

When and Why Does an Airplane Blink at You?

WHAT I don't know about airplanes would fill quite a decent-sized volume. One thing especially has puzzled me. It's this: some of the planes that pass over my house at night seem to have blinking lights, first on the wings and then on the tail. Is this my imagination, or is it some signalling system? And if it really is so, how is the blinking thing accomplished?—C. D. W., New York City.

It's no imagination, C.D.W., the lights really do blink. Soon after war began, all commercial airlines adopted blinking tail lights of alternate red and white flashes. Most airline transports now have not only blinking red and white tail lights, but a blinking red light on the left wing tip and a blinking green light on the right wing tip; also, in some cases, additional blinking white lights above and beneath the fuselage cabin. It is purely a safety measure, and is used only in the United States.—Ed.

DRAFTING

SPRINGBOARD TO SUCCESS!

MANY men today are using drafting boards to help win this war! • The International Correspondence Schools Courses in Mechanical or Architectural Drafting have fitted many hundreds of ambitious men for better jobs in this well-paid field!

• All I. C. S. Courses (covering 400 business and technical subjects) are prepared by leading practical authorities, constantly revised to meet new developments. Yet the cost of I. C. S. training is surprisingly low. • It's not too late for you to start—help your country, help yourself! Mail this coupon today!

DISCOUNT TO DISCHARGED VETERANS—SPECIAL TUITION RATES FOR MEMBERS OF THE ARMED FORCES

Here's How You Can STOP wearing out your Car with COLD WEATHER “DRY STARTS”

During cold weather low viscosity winter oil quickly drains off of hot cylinder walls. When you stop your car—cylinders and pistons quickly become cold and dry of oil. When you start—metal rubs metal causing rapid wear. A pint of Pyroil in the crank-case gives winter oil the property of clinging to metal surfaces. It reduces wear—it prevents rusting and corrosion and “gumming.” Ask your service man for Pyroil!

Manufactured and
Guaranteed by Pyroil

This Writer Tells Why He Takes Ouija Seriously

IN YOUR December number a person asks for an explanation of the Ouija board. Since my mother used it, I am qualified to give the needed information. No one can get results with it alone unless he has mediumistic abilities, but often two people can get results even if they know nothing about how it is done. The spirits do the manipulating by controlling the muscles that move the pointer to spell out what they want. The spirits can do nothing that a human being can notice unless there is some medium that they can draw power from to accomplish the result; the better the source of power, the better the result.

My mother used her Ouija board for many years, and got great comfort and pleasure from it. In one case it foretold an event accurately.—A. V. B., National City, Calif.

A Fair Question; but Tell Us Where to Get the Steak

FOR THE SMART DOG

SOME of the boys were having an argument about using the new radio waves in cooking, and we got on the subject of how much control there is. Here is my question: If you froze a steak in a block of ice, would it be possible to fry or broil the steak without melting the ice?—H. G., U. S. Naval Training Center, Farragut, Idaho.

Using short radio waves from a powerful diathermy apparatus, it should be possible to cook a steak without melting a block of ice surrounding it. Only the ice immediately in contact with the steak would be liquefied, by the heat of the meat itself. The heating effect is due to electric current set up in a conducting object by the short radio waves, and the steak would be a much better conductor of electricity than the ice. Therefore, no directional or focusing control would be required in this case. Since ultrashort radio waves can be controlled by suitable reflectors, however, there seems to be no reason why they could not be directed or focused exactly like beams of light.—Ed.

"Meet the new foreman, Mrs. Irvin!"

• How would you like to carry home the news that you've been advanced to foreman? You've thought about it, of course. But what have you done about it?

Training is the dividing line between the man at the machine and his foreman. It outweighs long service. Promotions to supervisory rank go to the men who have equipped themselves for the step up.

Have you studied the managing of men at work? Do you have a trained man's knowledge of Wage Systems and Job Evaluation, Production Planning, Control of Materials, Control of the Quality of Manufactured Goods?

The famous Foremanship Course of the International Correspondence Schools gives you these — and much more. Don't let the other fellow "step over your head." Mailing the I. C. S. coupon has meant success for thousands of ambitious Americans. Act now to join them!

INTERNATIONAL CORRESPONDENCE SCHOOLS

BOX 740-L, SCRANTON 9, PENNA.

SELLS 95 STORIES AND NOVELETTES

"The introduction you gave me to your editor friend, resulting in my present assignment to do a complete novel for him monthly, is doubly appreciated since I finished my V.I.A. training some time ago and consequently, have no call on your services. To date now, I have sold 95 stories and novelettes to 20 national magazines. Darrell Jordan, P.O. Box 279, Friendship, New York.

Why Don't You Write?

It's much simpler than you think!

SO many people with the "germ" of writing in them simply can't get started. They suffer from inertia. Or they set up imaginary barriers to taking the first step.

Many are convinced the field is confined to persons gifted with a genius for writing.

Few realize that the great bulk of commercial writing is done by so-called "unknowns." Not only do these thousands of men and women produce most of the fiction published, but countless articles on business affairs, home and shop crafts, local and scientific activities, gardening, homemaking, etc., as well.

Such material is in constant demand. Every week thousands of checks for \$25, \$50 and \$100 go out to writers whose latent ability was perhaps no greater than yours.

The Practical Method

Newspaper work demonstrates that the way to learn to write is by writing! Newspaper copy desk editors waste no time on theories or ancient classics. The story is the thing. Every copy "cub" goes through the course of practical criticism—a training that turns out more successful authors than any other experience.

That is why Newspaper Institute of America bases its writing instruction on the Copy Desk Method. It starts and keeps you writing in your own home on your own time. And upon the very same kind of *actual assignments* given daily to metropolitan reporters. Thus you learn by doing, not by studying the individual styles of model authors.

Each week your work is analyzed constructively by practical writers. Gradually they help to clarify your own distinctive style. Writing soon becomes easy, absorbing. Profitable, too, as you gain the "professional" touch that gets your material accepted by editors. Above all, you can see constant progress week by week as your faults are corrected and your writing ability grows.

Have You Natural Ability?

Our Writing Aptitude Test will reveal whether or not you have natural talent for writing. It will analyze your powers of observation, your imagination and dramatic instinct. You'll enjoy taking this test. There is no cost or obligation. Simply mail the coupon below, today. Newspaper Institute of America, One Park Avenue, New York 16, N. Y. (Founded 1925)

● Leaders in science and industry have long been saying, "Keep your eye on Plastics." But now the time for action has arrived. The future of huge possibilities has already begun. Developments in Plastics for hundreds of wartime uses have set the pace for revolutionary changes in peacetime production of thousands of products.

Today there's a big need in vital war production for those who are trained in Plastics. From one to a hundred articles made of Plastics must be supplied for every man in our fighting forces. Start training now in Plastics Engineering, in spare time in your own home. Fit yourself for a responsible, well-paid position. Help to win Victory. And at the same time you will be preparing for even greater opportunities when the war is over.

There is scarcely an industry in which these so-called "miracle materials" will not play an important part. After the war many old materials, methods and skills will be replaced. Acquire the all-important "know how." Be in a position to step into one of the key jobs.

YOU CAN LEARN WHILE YOU EARN

Turn at least part of your leisure time into money. Qualify at home for a larger income in an interesting career. Build greater security for your future in a vocation that looms large on the horizon of the new industrial era. Hours you might otherwise waste can put you well on your way toward lasting success.

It's easy to find out about Plastics training. To get details and outline of study prepared by specialists, and about the school that has helped thousands to success during the past 46 years, write us or check and mail the coupon. Send today. The sooner you take this easy step, the sooner you will reach your goal and reap the rich rewards.

AMERICAN SCHOOL OFFERS COMPLETE TRAINING SERVICE IN MANY SUBJECTS

You who have not completed high school or have missed vocational training in college, and who cannot spare time to go away to school, can complete your education in your choice of many subjects. Several of these are listed in the coupon at right. Check the subject in which you are interested, fill in your name and address, clip and mail the coupon today.

HOW WILL YOU FIT INTO THE POSTWAR WORLD?

LEARN PLASTICS NOW!

Plastics are playing an increasingly important part in almost every industry—improving old products and creating new ones. That is why such a brilliant future is predicted for plastics in the postwar period—offering opportunities to farsighted men and women who know plastics. Now is the time for you to prepare for a career in this fast-growing field.

LEARN AT HOME—You can learn plastics in your spare time at home without interrupting your present work. The Plastics Institute has developed a thorough, easy-to-understand course of training, requiring no previous technical experience. It offers complete, authoritative training based on industry requirements.

FASCINATING COURSE—The lessons are readily grasped and practical. Every step is made clear with graphs, diagrams, pictures. Actual specimens of plastics materials are furnished. A bi-weekly bulletin, "Plastics Trends," keeps you posted on new developments.

Dept. PS-2, 122 E. 42nd St., New York 17—Dept. PS-3, 221 N. LaSalle, Chicago 1—Dept. PS-2, 106 S. Alvarado, Los Angeles 4

COMPREHENSIVE—Learn the various phases of plastics from this course... materials, designing, molding, fabricating, estimating and plant management. Acquire a basic knowledge of plastics that can be invaluable in preparing you to take your place in this great new industry.

EXCLUSIVELY PLASTICS—The Plastics Institute is America's oldest and largest plastics educational organization which devotes all of its facilities exclusively to plastics. It is held in high esteem by members of the plastics industry. Many of our graduates hold responsible positions in the plastics field.

REPAIR ANY KIND OF RADIO EQUIPMENT

PREPARE NOW FOR A BETTER JOB AT HIGHER PAY IN THE RADIO-ELECTRONIC FIELD!

Complete Basic Radio-Electronic Training for Beginners...FOR ONLY \$5

EASILY WORTH \$50 IF YOU BOUGHT IT AS A COURSE

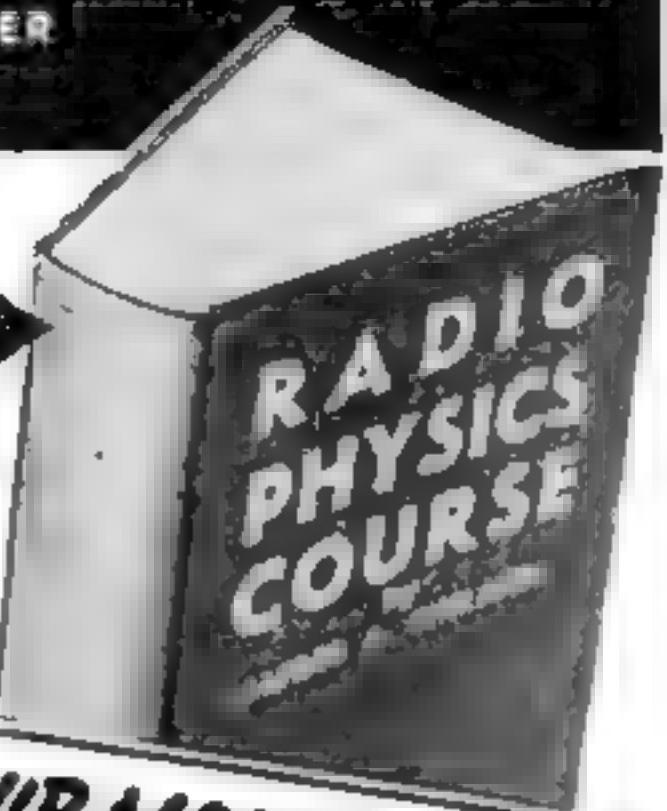

No skill Radio-Electronic Training doesn't have to be expensive to be good. Actually, A. A. Ghirardi's famous 972-page RADIO PHYSICS COURSE book gives you just the training you need—**ALL YOU NEED**—easier, better, faster—**AT A TOTAL COST OF ONLY \$5 (\$5.50 foreign).** No previous training is necessary. RADIO PHYSICS COURSE book carries you rapidly

through Basic Electricity (over 300 pages) to the latest Radio-Electronic developments. Nothing is omitted or condensed. Each step is made crystal clear by thorough explanations and by more than 500 illustrations. Each section contains Self-Testing Review Questions so you can check your progress every step of the way. There are no lessons to wait for—no monthly payments to make.

★ More universally used for home study, by more Signal Corps, Navy and civilian schools and colleges than any other book of its kind!

All you need is a little spare reading time plus a desire to get started NOW to make more money in the rapidly expanding fields of broadcasting, aviation radio, F-M, Television, radio servicing, electronic manufacturing—or any other of Radio-Electronics' fast growing branches. RADIO PHYSICS COURSE is famous for making it easy for beginners to learn Radio-Electronic fundamentals—at home without an instructor.

You can understand every word without previous training. You'll be pleasantly surprised how easily you'll master the subjects that other books and courses make seem very complicated. Our 5-Day Money-Back Guarantee enables you to examine this great book for five full days—and get every cent of your money back if you're not more than satisfied. Send coupon today!

YOUR MONEY BACK

In 5 Days If Ghirardi's RADIO PHYSICS COURSE doesn't teach you EASIER, FASTER, and AT LESS COST than any other Radio-Electronic book or course!

HERE'S HOW TO LEARN MODERN SERVICE WORK without an Instructor!

Ghirardi's MODERN RADIO SERVICING is a complete book of the day's high, best service book & guide to modern radio repair work. Written by one of the foremost radio technicians in the field, it shows you step by step through all phases of the work. Used for reference by book clubs, schools, etc. This comprehensive book will give you the job that paid for you. Requires ALL that is

needed to do the work. It gives you all data for repairing your own radio equipment. Troubleshooting Procedure and Circuit Analysis. Testing and Repair of Transistors, Vacuum Tubes, Transistor Components, etc. All 411 ways of repairing radio troubles. 200 pages, 700 illustrations. Price: \$5.00. Only \$5.50 foreign. 5-Day Money-Back Guarantee.

JUST LOOK UP

THE AERO TECH CAMPUS

Covering many acres and thousands of square feet of modern laboratories, shops and classrooms. Many civilians and Servicemen received their start in aviation from here.

...TO VETERANS OR SERVICEMEN

Expand your aviation knowledge by planning now to enroll in Aero Tech's special, advanced courses. This will insure your post-war opportunities in the new "aviation age," which will require trained, alert men by the thousands.

...TO CIVILIANS AND WAR WORKERS

You can do a better job in basing victory by working in a Los Angeles essential industry and taking Aero Tech courses at the same time. The training is especially laid out for the post-war aviation era—investigate this plan.

GREATLY EXPANDED COURSES

New requirements by airlines, service depots, feeder-lines... and the need for new types of aviation-trained men has created many new courses now offered by Aero Tech. Always up-to-the-minute, Aero Tech steps ahead with special plans for the aviation age of the future.

Servicing — many types of modern airplanes used for practical shop instruction.

Airport operations — Aero Tech students get actual experience on a leading Los Angeles airport.

Engineering — complete design projects are carried out by Aero Tech students.

Flight Engineer — An entirely new field open to men who know multi-engine planes and their requirements.

Instruments — latest type instruments, gyro, automatic pilots used for training.

Engine overhaul — all modern types of radial and in-line engines used for training.

Approved by CAA for Aircraft and Engine Mechanics Training

GET COURSE BULLETINS NOW . . .

TIE UP YOUR FUTURE
with these Growing Industries

REFRIGERATION AIR CONDITIONING

Air Conditioning and Refrigeration are among the great industries of today and tomorrow. Installations everywhere—in restaurants, shops, homes, etc., need service. Thousands of businesses are waiting for new installations. The day may come soon when homes, too, will be air conditioned. The Refrigeration and Air Conditioning Industries are headed for greater prosperity and men who have the "know how" and experience should ride along.

Train Now Before the Expected EXPANSION Begins

Experts predict large demand for men to install and service Air Conditioning and Refrigeration equipment... Rise to the kind of job which requires a competent, trained man who can carry the responsibilities of installing costly equipment and maintaining it. If he knows the answer when he is called in for consultation, his reputation grows and his pay should grow also.

Historic SUCCESSES May Repeat
Do you realize where you might be today if you had been in on the ground floor when some of our great industries began? Men who see ahead are those apt to be the ones who later cash in on the growth of the industry.

Follow This Way to Knowledge

Here is all it will take to get you ready for experience in this modern industry. You just invest a limited amount of your spare time—while you are at it on your present job. Through our balanced training, you learn first through home study, how to handle installation, maintenance, and service work on Refrigeration and Air Conditioning equipment. Then you can get practical experience in our big shops under capable instructors—practical men who will take a personal interest in helping you learn. When you are through you should have the knowledge that enables you to get started in this fast industry.

GET FREE FACTS RIGHT NOW!

It costs you nothing to get all the facts about this great field. Simply mail the coupon below and we'll tell you, without obligation the whole, sensational story of what's ahead in Refrigeration and Air Conditioning. Mail the coupon now.

Increasing your hold on your job and giving yourself a chance for advancement

Few men deliberately plan to work坚持不懈, on self-improvement. If progress comes naturally, they're happy if it does; if they worry or ignore the situation. Yet it is possible to pay attention to self-improvement without consideration of success. A noticeable degree of advancement is practically assured only and who will make an intelligent and persistent effort. Thousands of men have proved this for themselves, with

The Croft Library of Practical Electricity

The Croft Library of Practical Electricity has 20 years of solid service experience on work as it is actually done. It is learned from cover to cover with the kind of hard-hitting facts you want written so that the beginner can easily understand. It is so sound in that much that it is the ideal guide of 20 months away from all books and magazines. Croft tells you how to succeed in your work, what to know about radios, motors, starters, commutators, transformers, etc., as well as the other mysterious electrical machinery of every type. Writing the right and pain-free name of the shop he belongs to, his tools and more, just requirements. He can start in the very minute. The most advanced methods of lighting, heating, and power effects, etc., which you do a complete job from planning to completion.

No money down—easy payments

Please send me the coupon attached and we will send you the entire set of books, minus the ten dollar examination fee deposit. We take at the earliest opportunity the advance. If you desire to keep the books, send us the ten dollars and the balance of the price \$3.00 a month, send the money now and keep the books for yourself.

McGRAW-HILL BOOK CO., 330 W. 43rd St., New York 18, N.Y.
Send me for 10 days examination on approval the Croft Library of Practical Electricity. Total of all subjects \$15.00 less \$3.00 in advance and \$3.00 monthly until the price of \$12.00 is paid. If not wanted, I will return the books postpaid. (To insure prompt shipment write plainly and hit to all lines.)

GIANT TELESCOPE OFFER

FULL 17 POWER—Over 3½ Feet Long!

Here's the BIGGEST TELESCOPE VALUE in all AMERICA

The Yankee Clipper Super Telescope is by far the longest, most powerful and finest Telescope ever made to sell at only \$1.98, with Carrying Case Free. Most Telescopes of this size and power sell at around \$15 and up. Yet, no matter how much more you might expect to pay, we absolutely guarantee that you can't buy a better Telescope than this one for less money anywhere in the country today.

Just imagine! It's over 3½ ft long yet so light in weight and so durably made, you can hold it in one position for hours. It's so powerful, you can clearly see far away objects which are almost invisible to the naked eye. You can see people and wild life miles away and watch what they're doing when they can't see you. Sensational! Exciting! Fun and adventure such as you've never known before!

Makes Far Away Objects Appear 17 Times Closer!

You'll get the thrill of a lifetime when you take your first look through the 17 power optically ground lens of this 3½ ft. long Yankee Clipper Telescope. It's positively amazing how far you can see. Bring blurriness almost no while distant objects 17 times closer to you—clear sharp, BIG as LIFE. Never a dull moment when you have this powerful Telescope handy. Explore the moon, the stars and planets. Spot airplanes, boats, distant land marks. Take this Telescope with you to the beach, on boat trips or mountaineering. Get a big, clear, close up from a distance of all forms of life, without fear of being seen. Watch people at play—see birds winged flight. Enjoy front row seats from way back at baseball games, fights and all sporting events. No limit to what you can do and see with this high powered Telescope. Order yours today before limited supply is gone. Only \$1.98 complete with Free carrying case on this special offer.

SEND NO MONEY TEST IT FOR 10 FULL DAYS—AT OUR RISK!

Send No Money! Just Mail the Handy Coupon Today! Upon arrival of Telescope with Free Carrying Case deposit only \$1.98 plus a few cents postage with postman. There's no risk. Use the Telescope for 10 full days. Forget it on objects in the sky. Have your friends try it. Convince yourself that here is America's biggest 17 Power Telescope value. If after 10 days test you're not positively thrilled and delighted with the way this 17 Power Telescope performs you to see great distances, return it without delay and we'll refund your money in full, no questions asked. Hurry you'll agree this is a fair and generous offer and a possible to make. Remember the supply of these premium telescopes is limited. And, too, further production may be curtailed at any time. So hurry! Mail the coupon today without fail.

Has THREE Large Precision-Ground Optical Lenses

The great optical quality of this telescope makes it ideal for military, scientific, and other major purposes. The lenses are made of glass and are of the highest quality and precision. They consist of a draw tube which holds the main objective lens and the eyepiece lens. The tube is made of a durable material and is designed to withstand rough handling.

Send No Money!

ILLINOIS MERCHANTISE MART, Dept. 3131
300 North Dearborn Street, Chicago 10, Illinois

Please rush me the Yankee Clipper 17 Power 3½ ft. long Telescope with Free Carrying Case. On arrival I will pay postman only \$1.98 plus few cents postage and COD charges, with the understanding that if I am not positively thrilled and delighted with the way this Telescope performs I can return it within 10 days and get my money back in full.

WELDING rods, all kinds, all sizes. Trial package 25¢ literature free. Western Welding Wire Co., 125 Santa Ave., Los Angeles 3, Cal.

BUILD your own 6-12 volt Arc Welder and soldering device from used material. Send \$1.00 for plans. Victory Arc Welders, Box 548, Dodge City, Kansas.

IF YOU SUFFER FROM A STUBBORN SKIN DISEASE

you owe it to yourself to try
The New SULFA Formula

SULFA Salverol FOR SKIN APPLICATION

Contains SULFANILAMIDE and SULFATHIAZOLE

The Wonder Drugs of the World War.
Quickly checks skin infections caused
by pus-producing germs in it.

ECZEMA, ATHLETE'S FOOT, DERMATITIS,
SKIN RASHES, ITCHY SKIN, PIMPLES,
SCALP SORES, ACNE, and many other annoying
and unsightly skin conditions.

SULFA SALVEROL is stainless and greaseless
... instantly effective in secondary skin infections.
No residue can live on the skin when SULFA
SALVEROL is applied. Never injures or irritates
the most tender tissues... promotes natural
healing. A true blessing for externally caused skin
conditions. Send for a tube of SULFA SALVEROL
today... the easy-to-apply fast action ointment,
with the pleasant odor. For external use only.

YOU'RE FREE TO TRY. Send to you on a 10-day
"Satisfaction or Money-Back" Guarantee.

with SOFT rubber-like PADS—at home—and CHEW ANYTHING. Make ANY plates BETTER THAN NEW in a few minutes. Wear upper and lower at all times with SOFT, COMFORTABLE, LASTING PADS, which cling, ending bother of powders. COM-FIT PADS are READY-MADE—easily applied—just stick in and trim.

No heat or cement required. These MODERN REAL PLASTIC pads last MANY months. Tasteless, odorless, sanitary. Clean as usual. Can be easily removed. Money back if not FINE. Save TIME and MONEY by mailing \$1.00 TODAY (for 4 pads) to COM-FIT CO., Dept. PA, 848 S. Madison St., Indianapolis 4, Indiana.

Quick help for Rupture!

Why put up with days . . . months . . . YEARS of discomfort, worry and fear—if we can provide you with the support you want and need! Learn NOW about this perfected truss-invention for most forms of reducible rupture. Surely you keenly desire . . . you eagerly CRAVE to enjoy most of life's activities and pleasures once again. To work . . . to play . . . to live . . . to love . . . with the haunting Fear of Rupture lessened in your thoughts! Literally thousands of Rupture sufferers have entered this Kingdom of Paradise Regained . . . have worn our support without the slightest inconvenience. Perhaps we can do as much for you. Some wise man said, "Nothing is impossible in this world"—and it is true, for where other trusses have failed is where we have had our greatest success in many cases! Even doctors—thousands of them—have ordered for themselves and their patients. Unless your case is absolutely hopeless, do not despair. The coupon below brings our Free Rupture Book in plain envelope. Send the coupon now.

Patented AIR-CUSHION Support Gives Wonderful Protection

Think of it! Here's a surprising yet simple-acting invention that helps Nature hold the average rupture securely but gently, day and night. Thousands of grateful letters express heartfelt thanks for relief from pain and worry . . . results beyond the expectations of the writers. What is this invention—how does it work? Will it help me? Get the complete, fascinating facts on the Brooks Air-Cushion Appliance—send now for free Rupture Book.

Cheap—Sanitary—Comfortable

Rich or poor—ANYONE can afford to buy this remarkable, LOW-PRICED rupture invention! But look out for imitations and counterfeits. The Genuine Brooks Air-Cushion truss is never sold in stores or by agents. Your Brooks is made up after your order is received, to fit your particular case. You buy direct at the low "maker-to-user" price. The perfected Brooks is sanitary, lightweight, inconspicuous. Has no hard pads to gouge painfully into the flesh, no stiff, punishing springs, no metal girdle to rust or corrode. It is GUARANTEED to bring you heavenly comfort and security or it costs NOTHING. The Air-Cushion works in its own unique way—softly, silently doing its part in providing protection. Learn what this patented invention may mean to you—send the coupon quick!

C. E. BROOKS,
Inventor

SENT ON TRIAL!

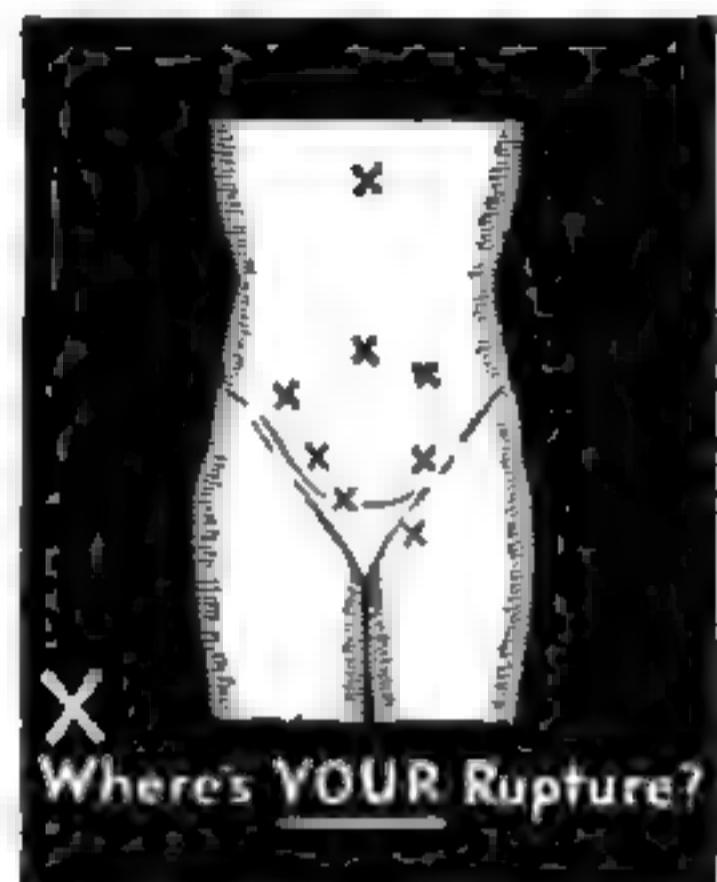

No . . . don't order a Brooks now . . . FIRST get the complete, revealing explanation of this world-famous rupture invention. THEN decide whether you want to try for the comfort—the wonderful degree of freedom—the security—the blessed relief that thousands of men, women and children have reported. They found our invention the answer to their prayers! And you risk NOTHING in making the TEST, as the complete appliance is BENT ON TRIAL. Surely you owe it to yourself to investigate this no-risk trial. Send for the facts—now—today—hurly! All correspondence strictly confidential.

Get the big rewards in **REFRIGERATION** **AND** **AIR CONDITIONING**

OPPORTUNITIES GALORE

IN THIS VITAL MAN-FAMISHED FIELD

YOU figure it out... Over 20,000,000 domestic and commercial refrigerators in use—and today, according to reliable sources, only about 8,000 experienced service mechanics to keep them in shape, where normally 20,000, and more, are employed.

Industry Needs Trained Men, Now. With such a situation as that, and with millions of home mechanical refrigerators out of use for lack of repairs and parts, is it any wonder the industry, today, is pleading and begging for competent service and repair men? Literally thousands of steady jobs at good pay are available **RIGHT NOW**.

More Trained Men Will Be Needed After The War. Vital war-needs and speed-up requirements have created startling new applications of cooling, humidifying, and the like, in industrial processes where they hadn't been used before. Leading authorities say civilian uses after the war are bound to force tremendous expansion in the refrigeration and air conditioning field. Quick Freeze, alone, is one example. Over 100 manufacturers are prepared to enter this field immediately after the war. Air Conditioning manufacturers expect a post-war jump of 300% in sales to a yearly volume of around \$300,000,000. All of this means new equipment to be installed, serviced, and repaired—and thousands of new jobs for men who are properly trained.

Train Now. Yes, NOW is the time to prepare for a successful career in this vital, growing field. Be ready to step into a good job with good pay and a bright future by the time V-E Day starts blowing from 3,000,000 to 11,000,000 war-production jobs sky-high, as predicted by Labor leaders.

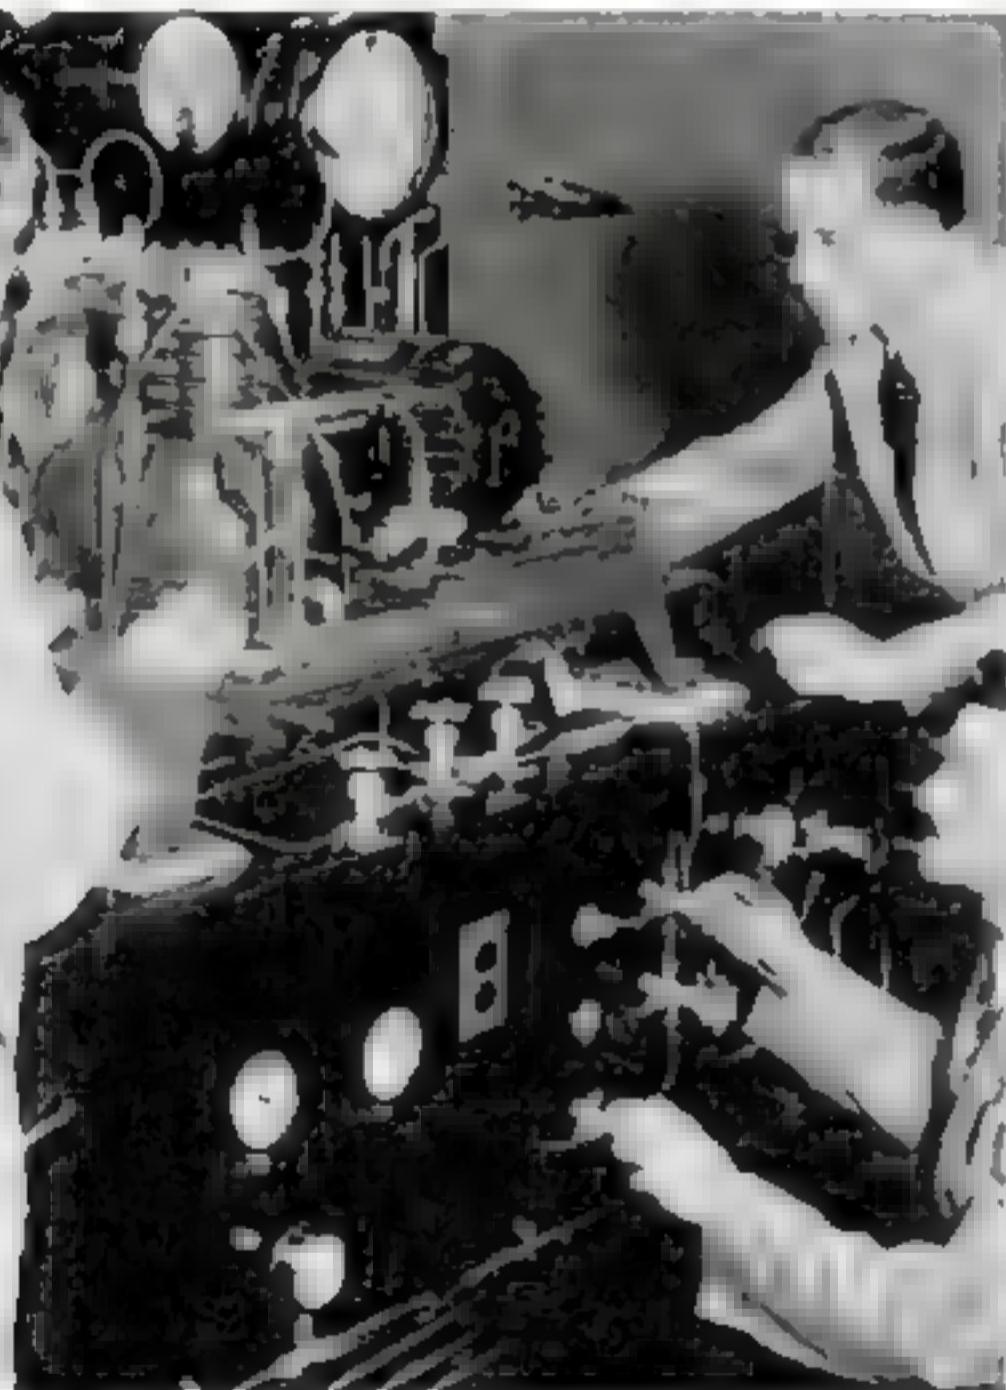

We'll Train You At Home In Your Spare Time. We'll train you at home, in your spare time, or if you prefer, in our big Chicago shop—the largest and most completely equipped refrigeration and air conditioning training shop and laboratories in the country;—or we'll combine both methods. Our simple, easy, step-by-step training system makes everything clear. You'll be amazed and delighted at how quickly you catch on, how easily you acquire the fine points, practical skill, and broad, technical "know-how" that makes the expert.

Proof of the soundness of our methods, and the high quality of our instruction, is the fact that for the past three years we have been exclusively training men and women in fine precision aircraft instrument work for the Army and Navy, under Government contract.

Easy-Pay Plan. Yes, no need to cramp yourself or lay out any big sum. Thousands of men in top-pay jobs today used I. T. I.'s easy pay-as-you-go plan to help them through—and so can you.

Quit Any Time. You can stop your Training at any point and any time you wish; and pay only for the actual time your Training was in force.

Get The Facts. Get the full facts about the many opportunities in refrigeration and air conditioning for properly trained men, now and after the war; and about I. T. I.'s unique and easy-to-grasp training that has helped so many men into key jobs in this Industry. Fill out the coupon and mail TODAY. No obligation.

INDUSTRIAL TRAINING INSTITUTE
2130-58 Lawrence Avenue, Dept. P2B, Chicago 25, Illinois

1900

The first "Munroe charge" blew a three-inch hole in the top wall of a heavy steel safe.

1945

Demolition charges employ the "Munroe effect" to knock open Axis pillboxes.

IT MAKES STEEL FLOW LIKE MUD!

THE BAZOOKA'S GRANDFATHER

How Prof. Charles E. Munroe's amazing discovery, reported in Popular Science Monthly 45 years ago, is now blasting enemy tanks and fortifications.

By VOLTA TORREY

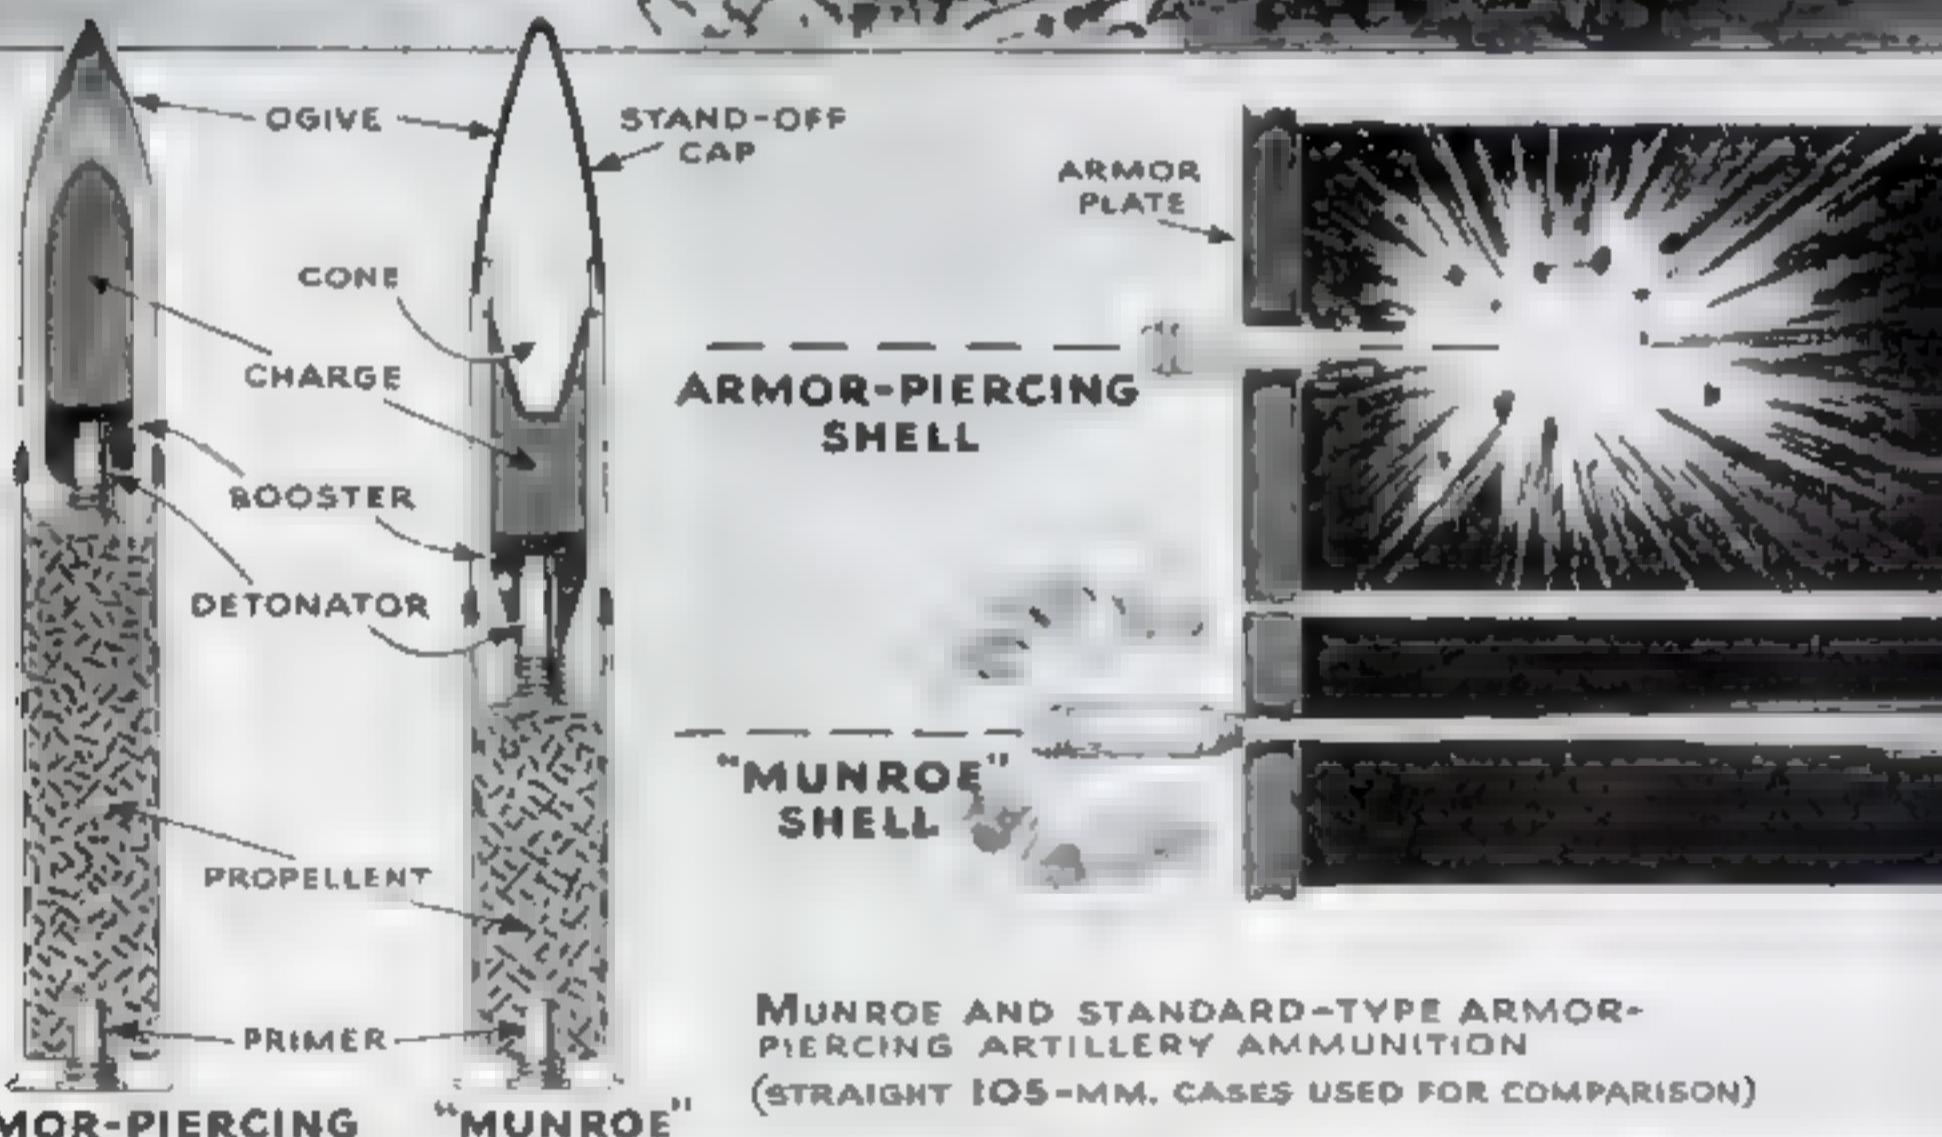

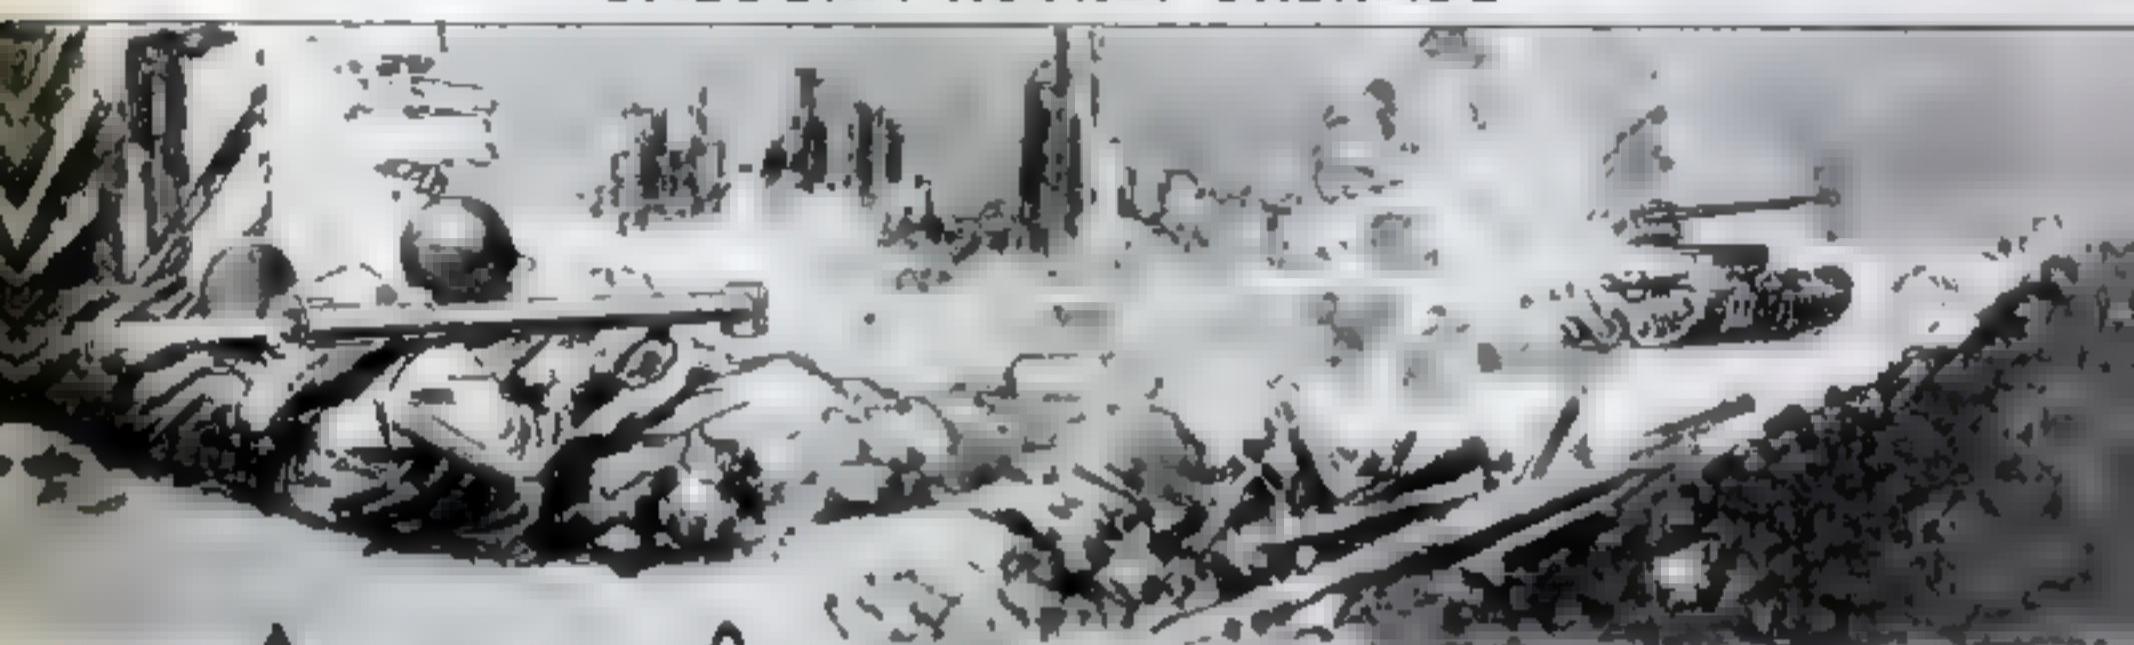

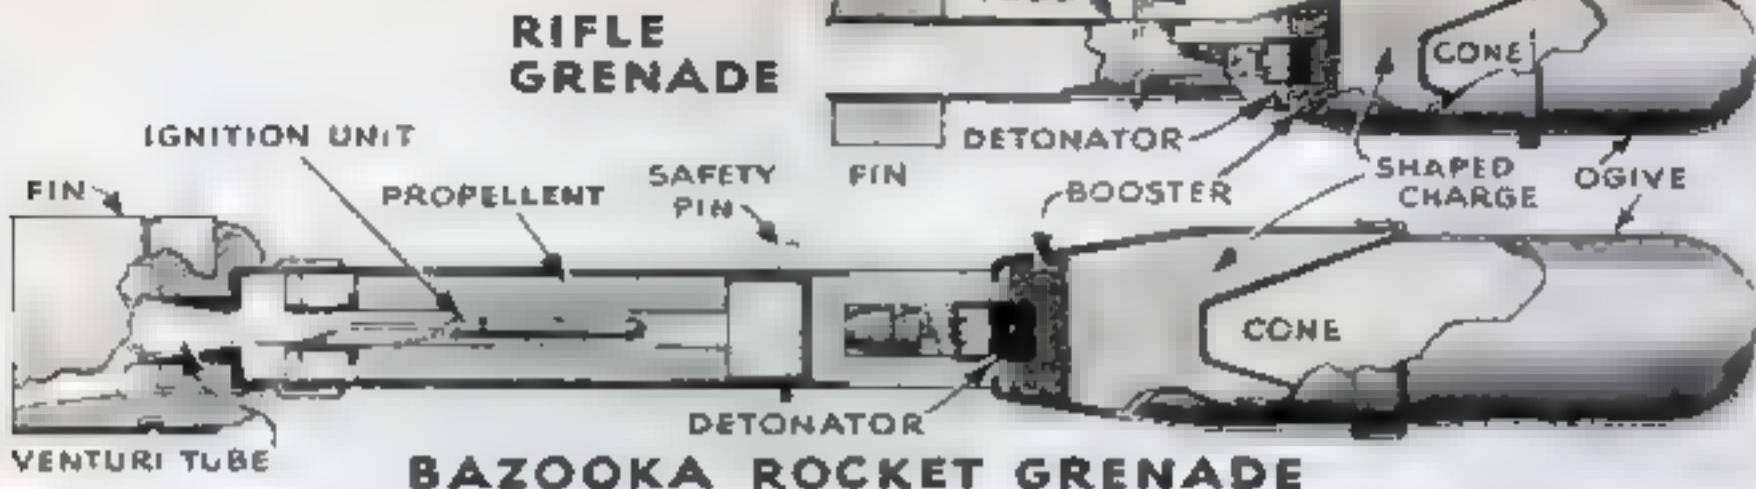

Drawings by B. G. SEIELSTAD

IN POPULAR SCIENCE MONTHLY, 45 years ago this month, Prof. Charles E. Munroe, of Columbian University (now George Washington University), reported his discovery of some "curious effects produced with explosive substances," for which he thought useful applications might be found. The most startling of those applications were not discovered until after Dr. Munroe's death in 1938; but they are proving extremely useful now, for they are enabling Army Ordnance to design weapons to punch holes in the thick, reinforced concrete and the heavy armor plate behind which our besieged enemies lurk.

The "Munroe effect" is the secret within many secret weapons, and its utilization is one of the most important scientific developments in the field of explosives during this war. It gave the bazooka its terrific wallop. And it is being used to bore into the very foundations of the fortifications, pillboxes, bridges, and other installations of the Germans and Japanese.

Dr. Munroe, who also helped develop smokeless powder, noticed this highly important peculiarity of explosives while working at the Naval Torpedo Station at

PROPELLED HOLLOW CHARGES

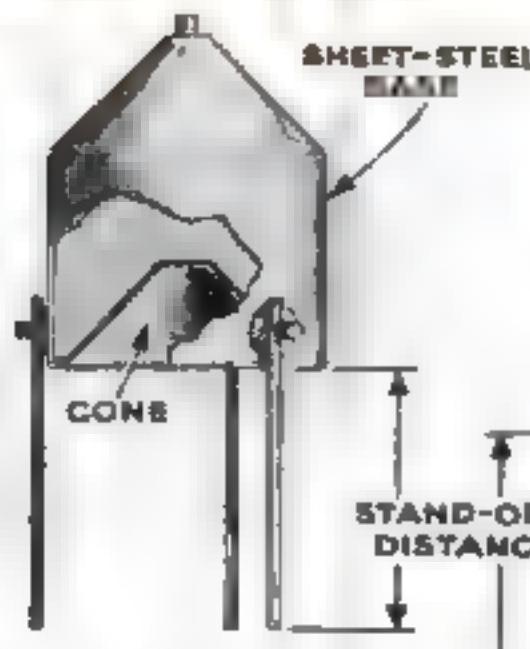

ARMOR-PIERCING "MUNROE"

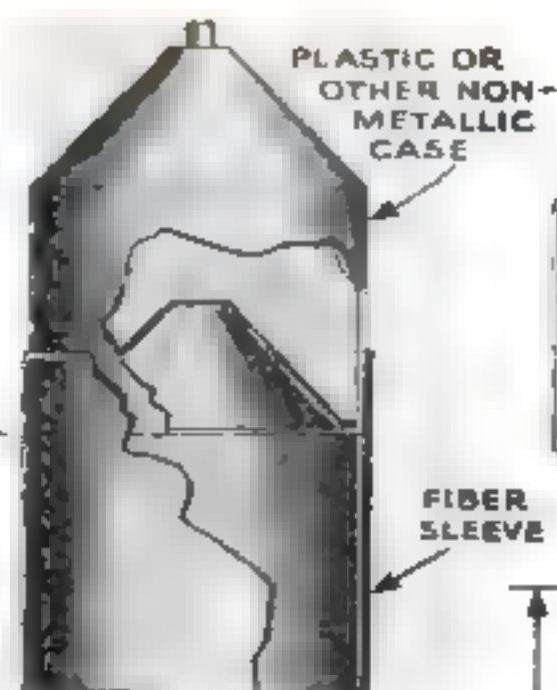

Newport, R. I., back in the 1880's. When gunotton was molded there, holes were bored in each cylinder for the insertion of a detonator. Letters and figures were also stamped in the cakes of explosive. And, in the course of his work Dr. Munroe found that when a block thus punched or indented was placed on an iron plate and exploded, indentations corresponding to those in the explosive were made in the plate.

Experimentally, he placed leaves, bits of lace, coins, and stencils between the gunpowder and the metal plates and succeeded in producing raised ornamental designs on the surface of the plates by setting off the explosive. Experimentally, too, he put sticks of dynamite around a tin can thus creating a cavity in the middle of a charge and found that he then could blow a hole in the side of a heavy steel safe with much less

HOW EFFECT WAS DISCOVERED

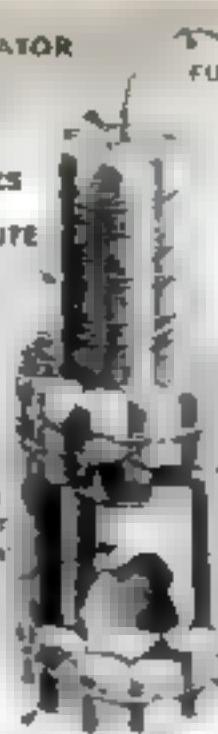

While testing explosives at the Newport, R. I., Naval Torpedo Station, Dr. Munroe noticed that cavities in blocks of guncotton were reproduced on iron plates on which the explosive was test-fired. Leaves placed under the guncotton were reproduced as raised patterns. These drawings were made from photos published in Popular Science 45 years ago.

DETONATOR

FUSE

DYNAMITE

TIN CAN
OPEN AT
BOTTOM

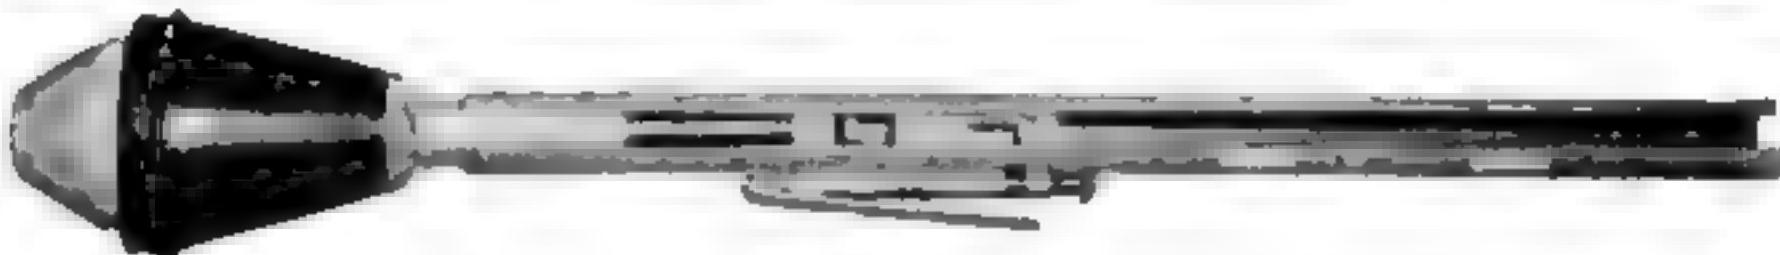

12 STICKS
OF DYNAMITE

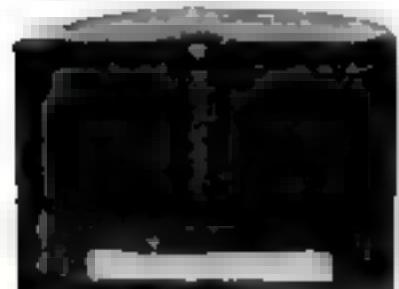

FIRST SHAPED CHARGE

When this crude hollow charge was exploded on top of a heavy steel safe, it blew a three-inch hole in the 4½-inch wall. The same amount of dynamite, arranged as a solid charge, had practically no effect on the steel safe wall.

OUR ENEMIES ALSO USE HOLLOW-CHARGE WEAPONS

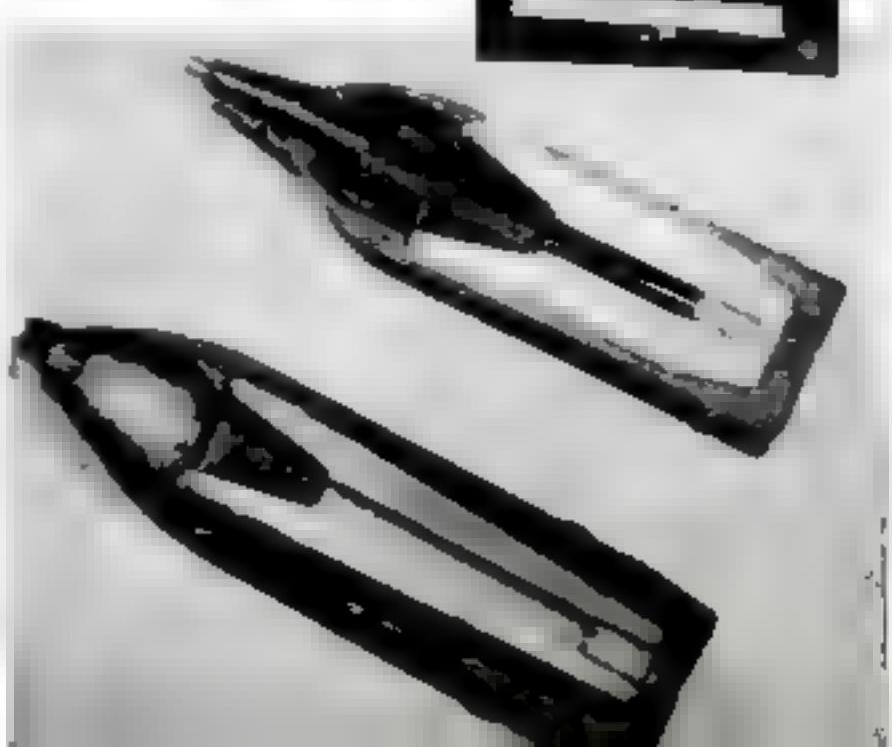

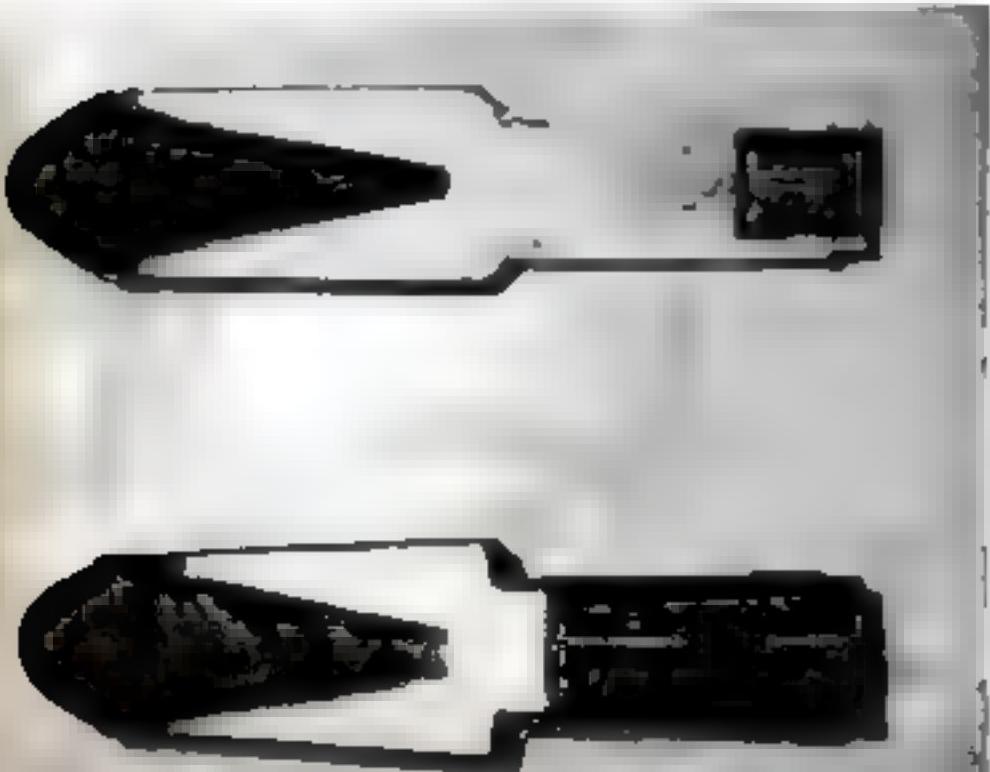

The German "Panzerfaust," fired against tanks from a hand-held launching tube, blasts armor with a conical charge 5.87 inches in diameter. This is not a rocket weapon; it is propelled by a cartridge in the launching tube, which is nearly a yard long. A folding sight enables it to be aimed with some accuracy.

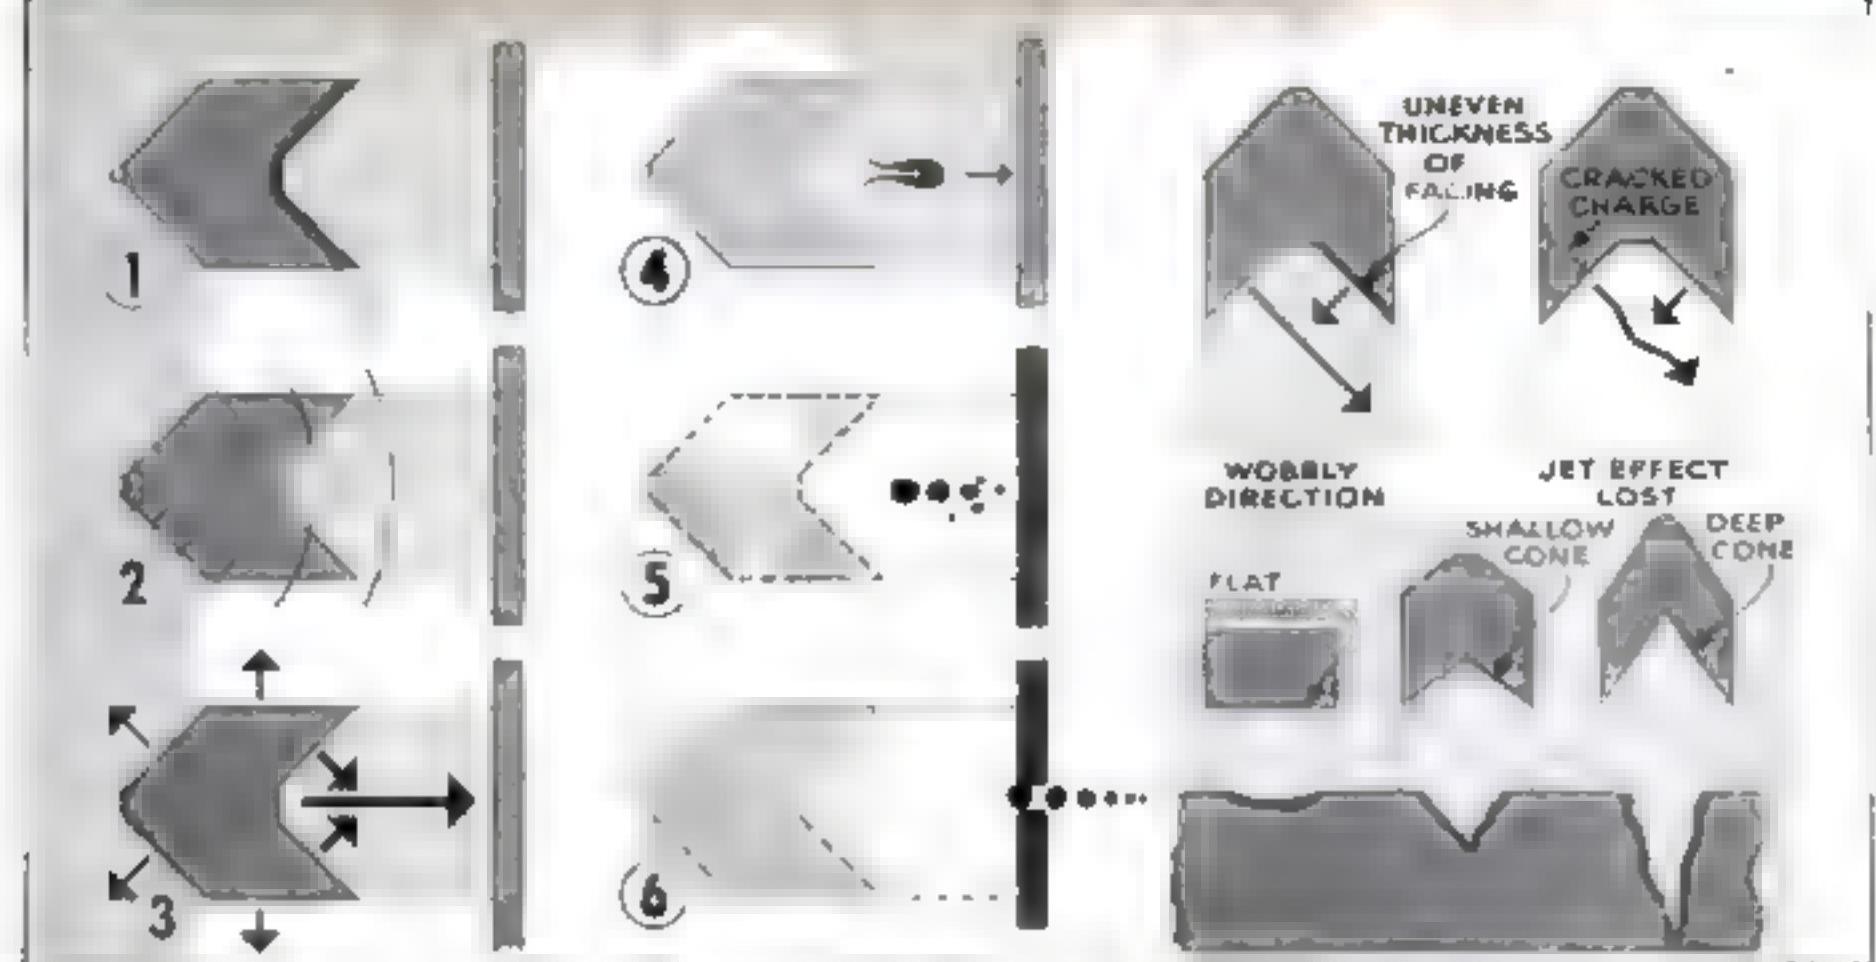

Below are a Jap hollow-charge rifle grenade (top) and German weapon from which it was copied. At left is a block of mild steel (not armor plate), showing a hole 3½ inches deep blown in it by the Jap grenade. Japs put fins on this grenade and drop it in clusters from planes.

Jap (top) and Ger-
man 75-mm. ho-
low-
charge artillery shells.
Our ordnance experts
say the Jap job is a
poor copy. The Nazi
shell tore a hole 6½
inches deep in the bil-
let of mild steel at
right, in tests at Aber-
deen Proving Ground

THE PRINCIPLE OF THE HOLLOW CHARGE

Explosion of hollow charge (1) creates detonation waves (2). In hollowed-out portion, force is concentrated to form a jet (3)

Metal torn off the cavity lining is turned inside out (4) or forms pellets (5) that join the jet to plow through armor (6)

Imperfections in the hollow charge may reduce its effectiveness, as seen in the upper drawings. Shape of the charge is varied to suit the target and the kind of effect that it is designed to produce

dynamite than would be needed if the whole charge were placed flat against the wall of the safe.

Dr. Munroe, in short, found a way to concentrate a portion of the force of an explosion on a particular spot. And that way, which seemed curious even to him, consists of leaving a cavity in the explosive at the very spot where the maximum force is desired. The British now call the Munroe effect "the cavity effect of explosives," and American experts often describe the blocks of explosives in which this effect is now used as "hollow" or "shaped" charges.

A Norwegian investigator had suggested much earlier that air space might be used to enhance an explosive's effect. The idea was taken to Germany in the 19th century, and applied in the mines in the Saar region, but did not catch on among German military men. A patent on an application of the idea was issued in Germany in 1910, and another patent was issued in Britain in 1911, but no nation did much with the idea during World War I. Interest in Dr. Munroe's principle was revived, however, a few years ago, and his work now has been continued by the Research and Development Service of the U. S. Army Ordnance Department with many remarkable results.

The Munroe effect may be obtained with any kind of high explosive by cutting a cavity of almost any size or shape in the side of the charge that is placed toward the object to be cut or punctured. Miners have been known to arrange sticks of dynamite

in the shape of a tepee to blow a hole in the ground. And demolition engineers sometimes have taken a jackknife and cut a little chunk out of a block of dynamite before placing it against an object to be severed.

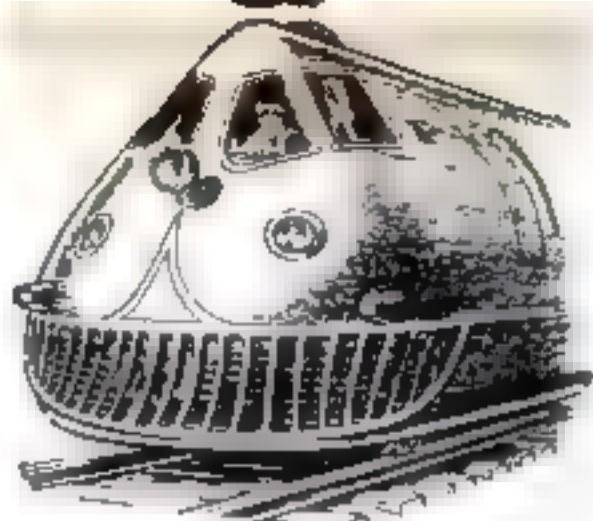

But, to attain the full benefit of the Munroe effect, the cavity must be shaped scientifically, a lining of the correct kind of material must be placed in this cavity, the charge must be held a certain distance from the object against which its force is to be directed, and the detonation of the explosive substance should begin at its rear. No simple rule is known yet by which the effectiveness of certain size or shape of cavity in different weights, shapes, and varieties of explosive charges can be predicted. By dint of much research, however, the Ordnance Department has provided our Army with a wide variety of hollow charges that can be counted on to produce definite results.

U. S. Army engineers, for example, use demolition charges that look like thick, stubby cones. These are placed in light metal cans, or even more fragile containers, with legs or rims to hold the large end of the cone a suitable distance from the surface to be hit with the maximum explosive force. The charge is then detonated from the opposite, or pointed, end of the cone.

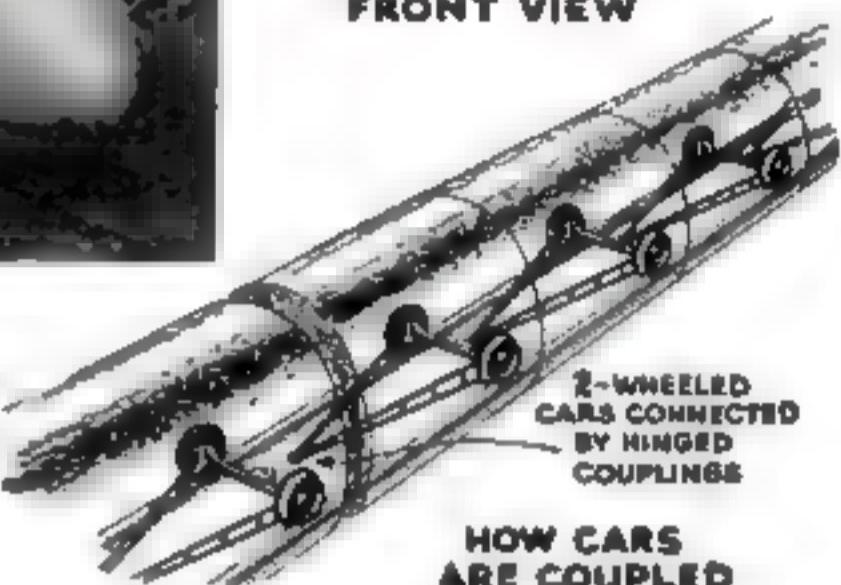

When it is touched off, a detonation wave races through the explosive substance. This is a chemico-physical wave that progresses from layer to layer of molecules, causing them to vibrate (*Continued on page 211*)

LOW-SLUNG TRAIN TRAVELS FAST. This new Spanish railroad train, light, streamlined, and Diesel-powered, makes 106 miles an hour on the straightaway, but slows down for mountain curves to a mere 80 m.p.h. Ordinary trains take curves at 30 or thereabouts. The inventor, Alejandro Golcochea, placed the center of gravity only half as high as usual, thereby making it possible for the cars to hold the rails in spite of greatly reduced weight. Axles

ARE COUPLED

have been eliminated; there are two separately suspended wheels at the rear of each car, while the front end is linked to the preceding car.

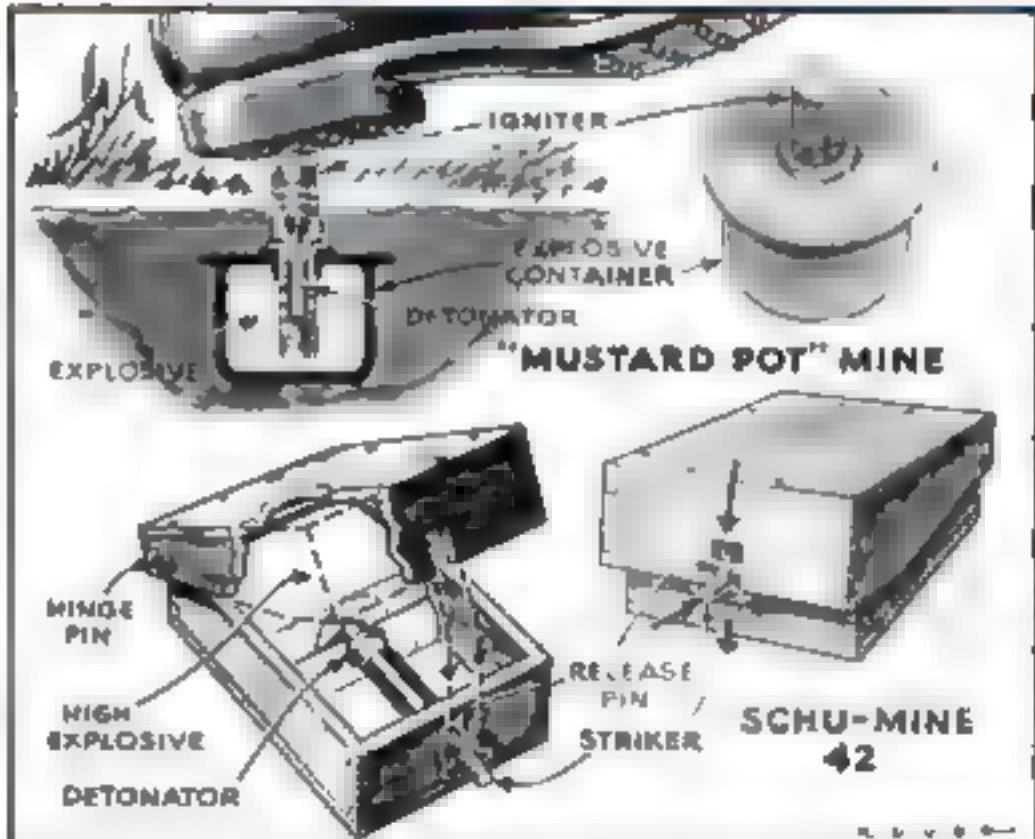

WELDED-STEEL CRUISER, known as Steelcraft, is a late development in the production of pleasure boats. The hull is fabricated from only seven pieces, welded and completely stress-relieved. The V-type bottom is formed of two pieces, the sides of two more, and there is one piece each for the deck, chine, and transom. The normal equipment is an 85-hp. motor. The builders of Steelcraft are Churchward & Co. of West Haven, Conn.

WEIGHTED REVOLVER aids Capt. E. W. Strother, Assistant Chief of Staff of the Seventh Naval District, to maintain his skill as a pistol shot while practicing indoors. He attaches weights totaling six pounds to the butt and trigger guard of his unloaded pistol, and pulls the trigger to the beat of a metronome. Eye and muscle control are kept at concert pitch, for unless he holds his arm steady, the weights swing like pendulums and indicate what would probably be a wild shot if he were shooting with a loaded weapon.

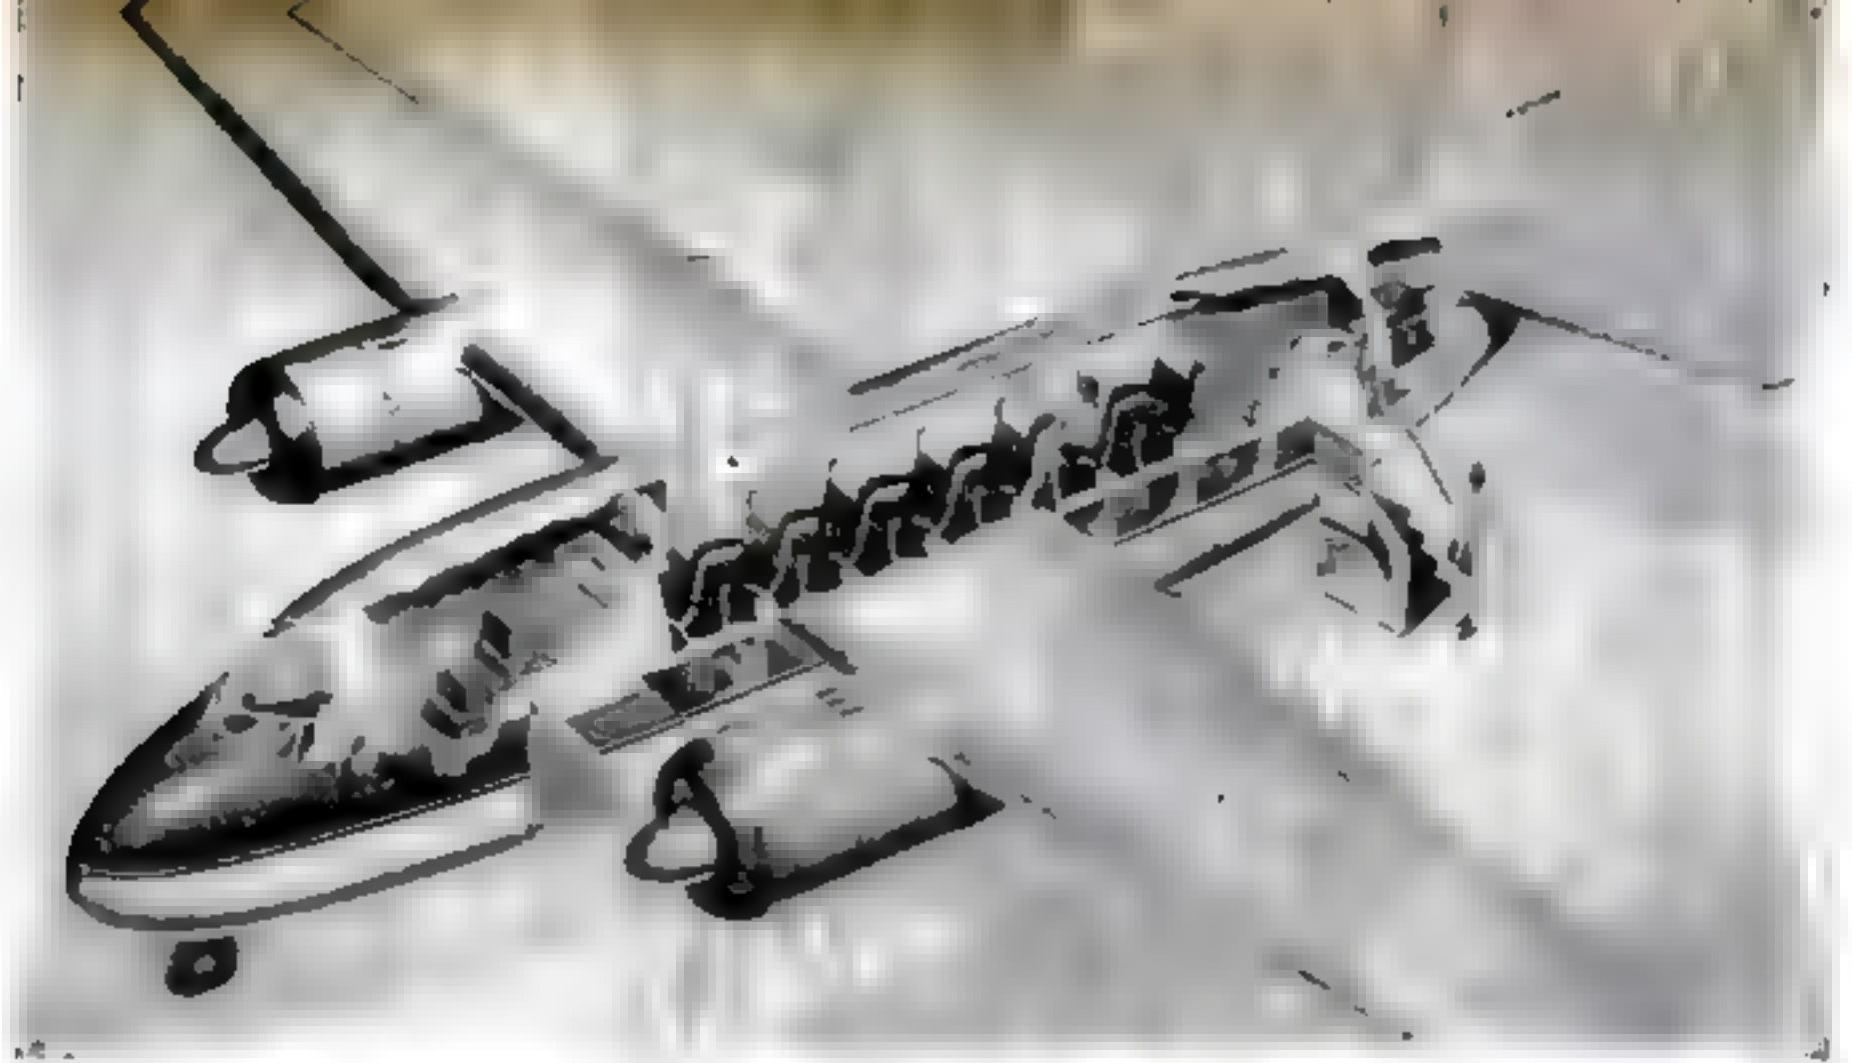

HEAD-WOUND GAS MASK developed by Chemical Warfare Service at the Massachusetts Institute of Technology will protect fighters with bandaged heads, faces, or jaws against poison gas. It consists of a silklike, translucent vinylite hood to which an air-purifying canister and outlet valve are attached to allow for ordinary breathing. There is a semiflexible transparent vinylite window to insure clear vision for the wearer. The mask is easily compressed, and an oblong waterproof plastic sack is provided for carrying.

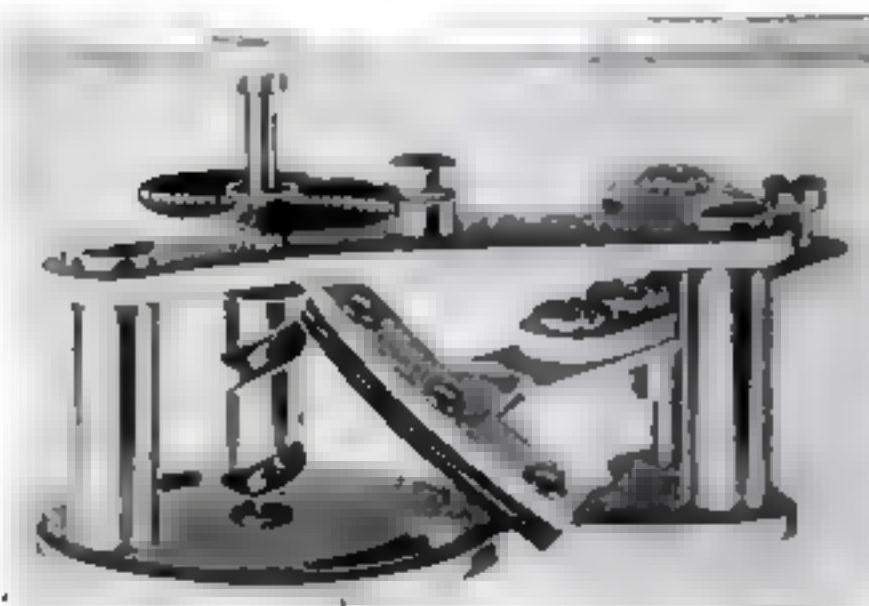

ANTIPERSONNEL MINES used by the Germans include the "mustard pot" and the "schu-mine," both of which explode at slight pressure. The mustard pot, so nicknamed by the Yanks because of the color it is painted, weighs 13 ounces, measures $3\frac{1}{2}$ inches in height by three inches in diameter, and is fairly easy to locate with mine detectors, though more difficult by probing. The schu-mine, set off by the tread of a shoe, is hard to locate with metallic detectors, owing to its small metal content. The casing, which includes the box and the free-moving lid, is made of impregnated plywood. It is laid so that the igniter points away from the enemy and the top of the lid should be level with the surface of the ground. If there is sufficient vegetation for concealment, it may even be laid on top of the ground.

THE NAVY needs trained nurses—at least 2,000 more by June 30. The need is urgent. Registered nurses, between 21 and 40, who are graduates of accredited schools of nursing, who have been citizens for 10 years, and who are single or legally separated, may apply for commissions in the Navy Nurse Corps. Application blanks and additional information may be had from The Surgeon General of the U. S. Navy, Bureau of Medicine and Surgery, Navy Department, Washington 25, D. C.

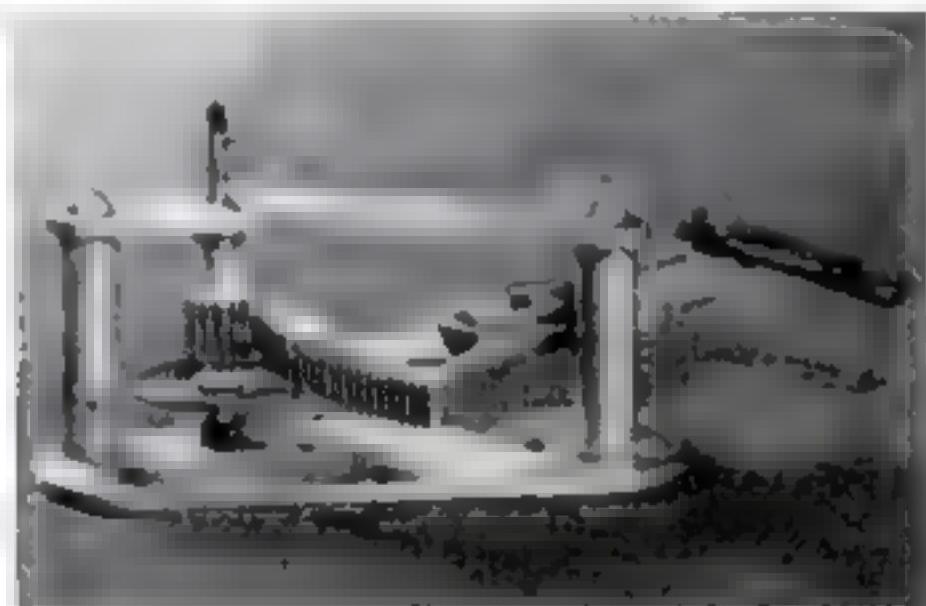

PLANE FOR SMALL-TOWN FIELDS, Saturn 75, is planned for postwar production by Lockheed. This all-metal, high-wing transport will take off in 1,055 feet, and can land at less than 75 m.p.h. Powered with two

525-hp. Wright engines, it can cruise at more than 200 m.p.h., and has a range of above 1,800 miles loaded with eight passengers, a two-man crew, and baggage. It has a tricycle landing gear.

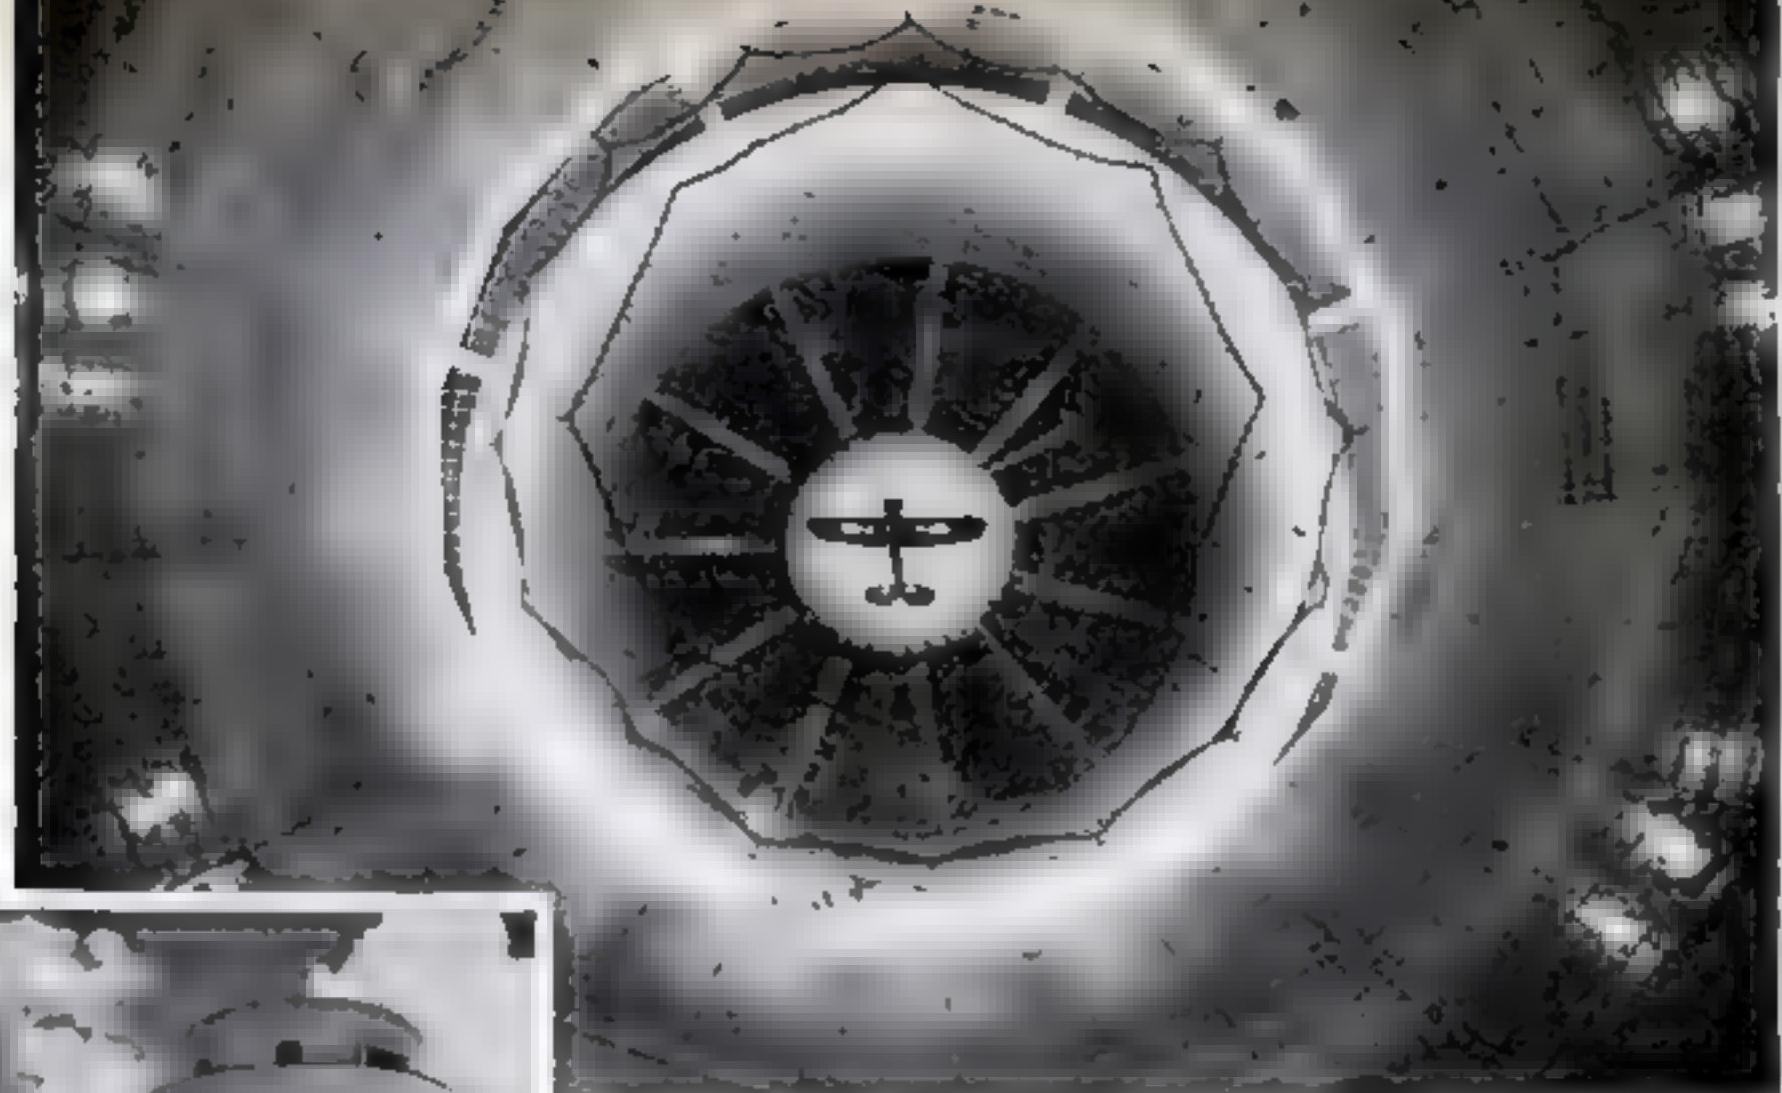

NEW GEARING for aircraft instruments achieves transmission of motion by an actuating cam and helicoid unit developed at the Certified Gauge and Instrument Corp.,

Long Island City, N. Y. The new mechanism, shown at the left, is less subject to wear, friction, and jamming from particles of dirt than the conventional type at right.

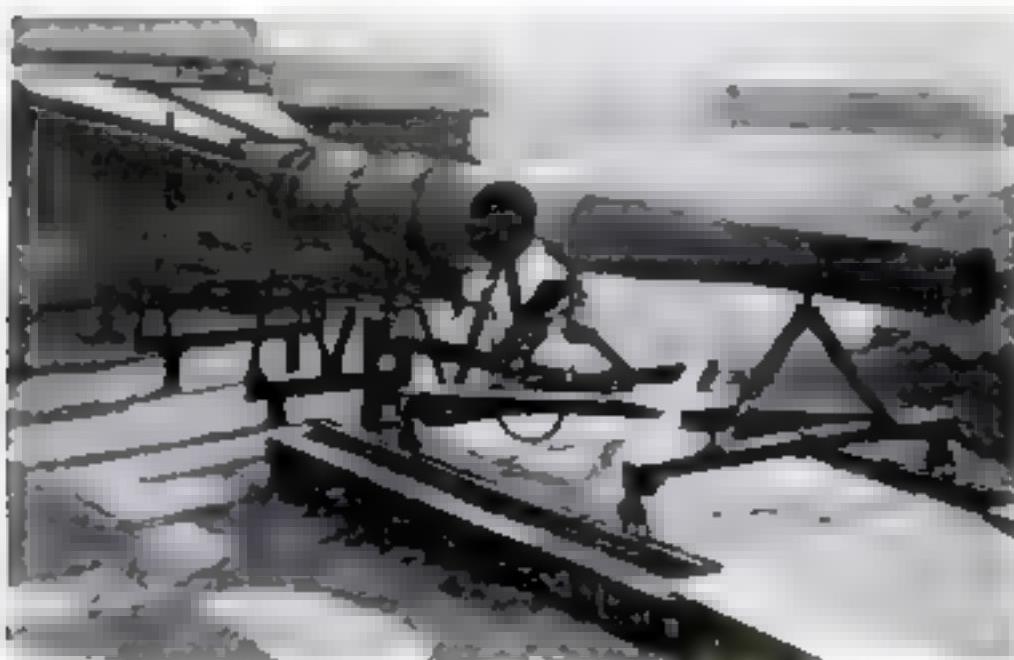

SHALLOW DRAFT, air-propelled boat, designed by Cecil S. Williams and Herton Jensen, biologists of the Salt Lake City office of the Department of the Interior, can penetrate hitherto inaccessible wildlife habitats. A very light hull and a stern-mounted airplane propeller combine to give a speed of 40 m.p.h. in water an inch deep.

VERTICAL WIND TUNNEL Certain tests hitherto impossible to perform, involving the study of airplane spin, experiments with helicopter rotor blades, and research into parachute behavior, are now being conducted at the 80-foot concrete vertical wind tunnel recently erected by the Air Technical Service Command at Wright Field, Ohio. View above shows interior, looking upward. Polished maple walls minimize airflow turbulence. A nylon net catches model planes, which are operated by remote control, at the end of each test. At the roof, a 16-foot, four-bladed wooden propeller creates drafts of more than 100 m.p.h.

ROBOT-BOMB ENGINE, reproduced from a mutilated Nazi V-1 that fell in England, is shown being tested in front of a 400-m.p.h. wind tunnel. This gas-fueled engine is one of a large number made by the Ford Motor Co. for Army experiments. It needs a high-speed blast of air to keep it in operation. A gate at the front end of the engine tube opens to admit air for combustion, and closes with each explosion to prevent loss of power. In operation, the engine sounds like a mammoth outboard motor. Over all, the bomb measures 17 feet in span, 27 feet in length.

HOT FOOD FOR FLYERS is served in the air from this electrically heated cabinet containing precooked chow. It was developed by the Very Heavy Bomber Technical Command for B-29 crews. Each drawer contains a meal for one man.

"JET" vs. "PROP"

500-MILE-AN-HOUR SPEED WILL CHANGE AIR-COMBAT TACTICS

THE entry of the jet-propelled plane into aerial combat on both sides might very well revolutionize sky fighting. The speed of the new craft is now said to be around 500 m.p.h., and already there is talk of 700 m.p.h.

This tremendous increase of speed, coupled with the jet plane's extraordinary rate of climb, would appear to give it a vast advantage over the propeller-driven ship. However, the jet has a definite weakness—lack of maneuverability.

The extreme high speed of the jet plane prevents it from making a turn in anything like the short distance possible to the average fighter. The pilot, if flying at top speed when confronted by a foe, must either go into a long glide or zoom suddenly.

These sketches, drawn for the *Illustrated London News* by G. H. Davis, show how the jet plane attacks the prop plane, and how it, in turn, may be attacked.

What will happen when jet meets jet in the skies is problematical. Possibly the aerial dogfight will revert from a horizontal to a vertical plane.

JET'S CLIMBING SPEED IS OFFSET BY BIG TURN RADIUS

A big advantage of the jet-propelled airplane, in addition to its terrific speed, is its phenomenal rate of climb. Thus future aerial warfare may reach heights where combat has heretofore been impossible.

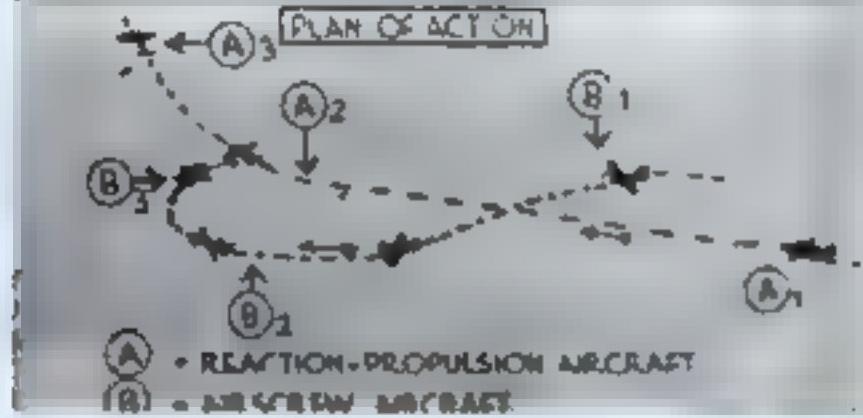

PROP-DRIVEN PLANE'S

1 A jet plane (A), zipping along at a 500-m.p.h. clip, swoops in behind a "prop" fighter (B) and prepares to attack it. But the other pilot spies his foe and makes a sudden sharp turn to the left

The disadvantage of the jet plane lies in its lack of maneuverability at extreme high speed. It requires about five miles for a complete turn, as compared with a mile and a half required by an average fighter.

MANEUVERABILITY AGAINST JET PLANE'S HIGH SPEED

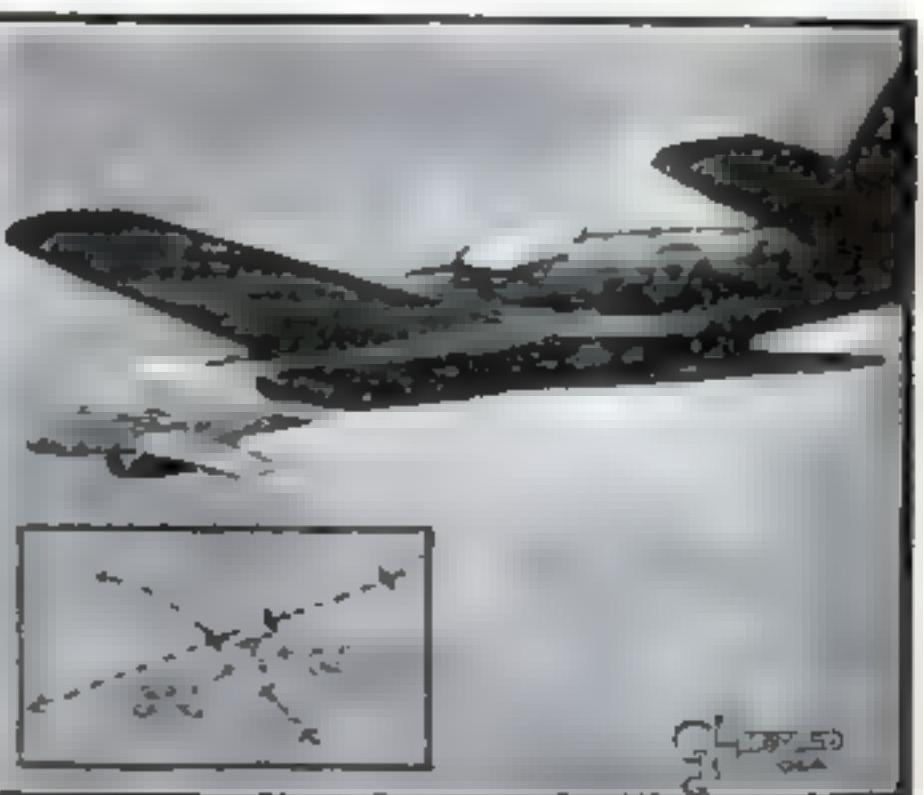

2 Because of the far greater distance he requires to turn in, the jet pilot is unable to keep up pursuit. The other pilot in the meantime makes another turn, cutting across the jet's line of flight.

3 Now pilot "B" is in position for a deflection shot, but he has less than a second to shoot, so great is the speed. The jet pilot now must either go into a climb or dive to avoid becoming a target.

DEFLECTION FIRING IS MORE DIFFICULT THAN EVER

A possible tactic for prop planes against the jet. A fighter (B) dives down on a jet (A) from the left; the jet begins a long turn to the right, but runs into a second enemy (C), who lets go with a burst

Aerial gunnery will become more than ever a split-second affair as speed goes up. Time for deflection shots will be narrowed to less than a second. Within moments, passing planes will be miles apart.

**THE NAZIS FIGURED IT WOULD TAKE 3½ YEARS
TO LAND OUR MILITARY RAILROADS IN FRANCE, — BUT —**

THEY'RE HIGHBALLING NOW!

We packaged them and put them ashore on the beaches by using "breathing bridges." How this engineering feat was done.

By DEVON FRANCIS

ON JUNE 6, 1944—D-day—more than 20,000 railroad cars and almost 1,500 locomotives sat on sidings and in marshaling yards of southern England. They lay in strings, mile on mile, like delicately articulated centipedes.

The Germans knew they were there. Air reconnaissance had told them so. They knew what they were intended for. And they weren't worried.

The Germans were sure that rolling stock never could be brought across 100 miles of white-capped water and landed in Normandy to carry supplies for the sustained offensive necessary to drive them out of France.

They held the ports. They would hold them to the bitter end. After that they would blow up the docks. How could the British and the Americans land heavy rolling stock without ports? It was that simple.

Yet on D-day plus 38, long before any Nazi-demolished port and its docks had been reconstructed, those cars and some light Diesel locomotives from those English sidings and yards began moving into France. They went right in across the sloping, sandy beaches in spite of a 24-foot tide.

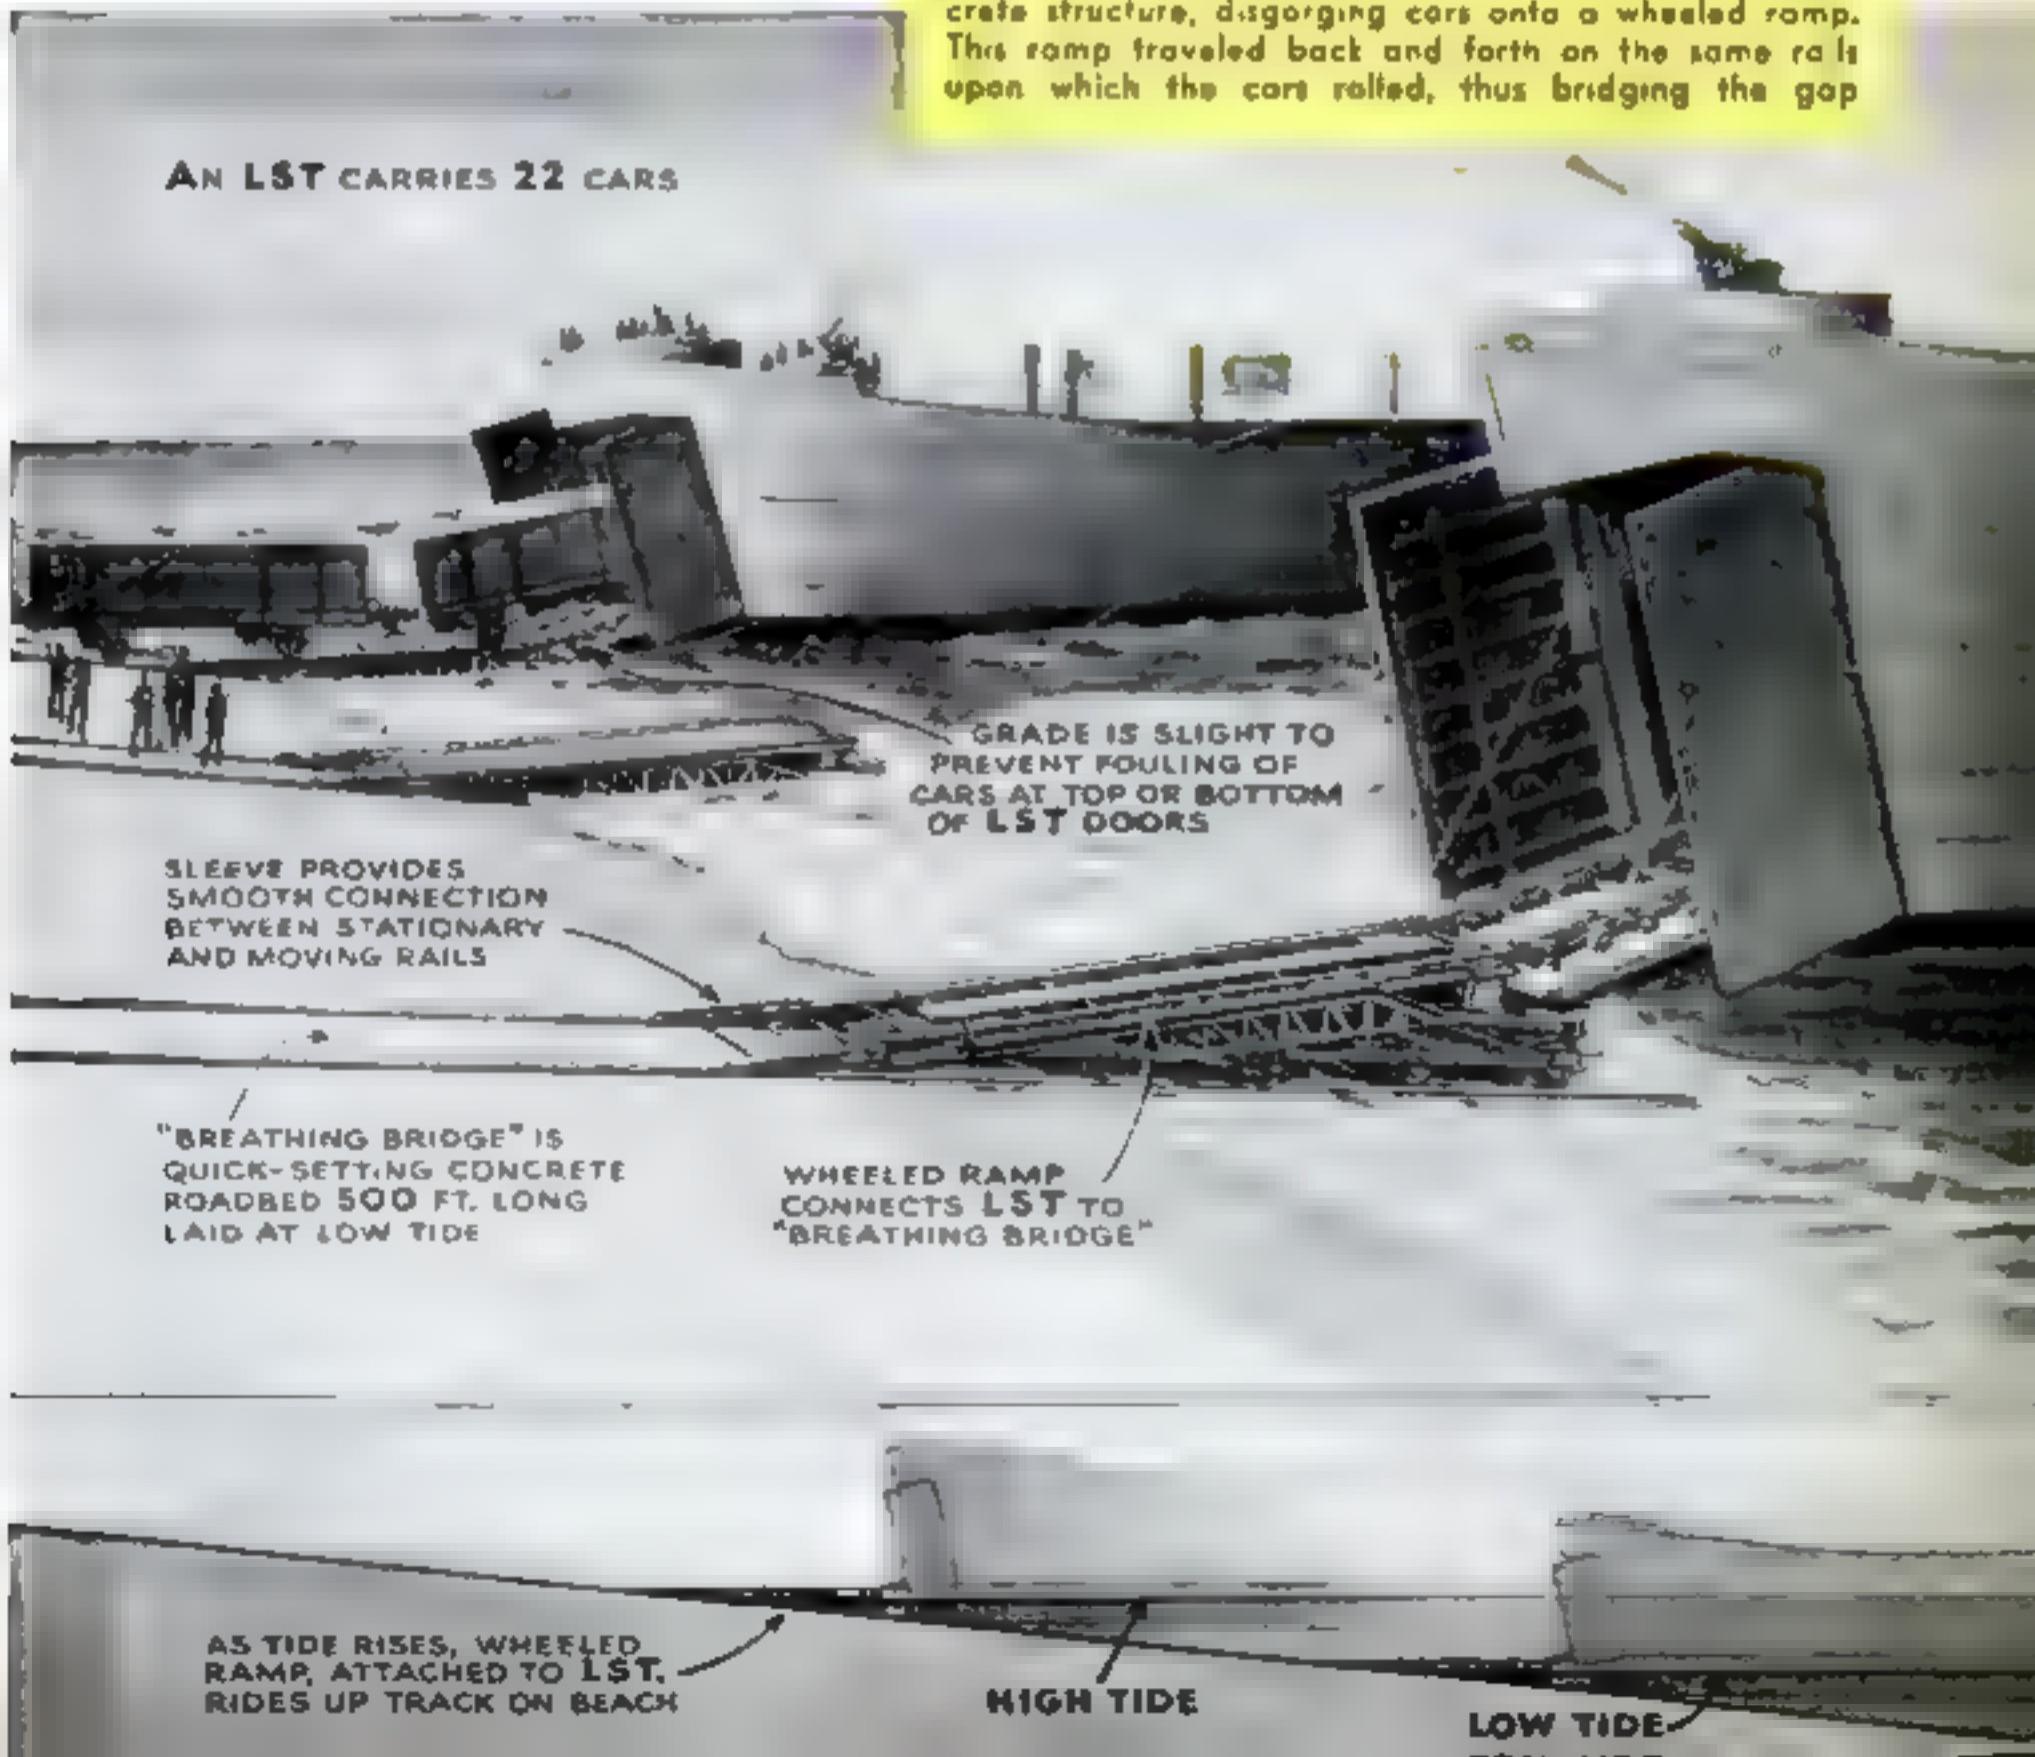

How this was done, how one of the war's great engineering feats was planned and executed, can now be told for the first time.

Much had preceded that chapter of the invasion. The Military Railway Service of the Army's Transportation Corps, which did the job, was warring on five continents.

It delivered supplies to China's

Drawings by A. G. SEJELSTAD

AN LST CARRIES 22 CARS

HOW RAILROADS WENT ASHORE

A gondola rolls from the gaping maw of a converted LST to a "breathing bridge" on a Normandy beach and Major Gen. Frank S. Ross, Chief of Transportation in the European Theater of Operations, follows along on a narrow gangplank. Below, artist Sejelstad illustrates the principle of the bridge, one of the war's greatest improvisations. As the tide changed, the shallow-draft LST's advanced or receded on the concrete structure, disgorging cars onto a wheeled ramp. This ramp traveled back and forth on the same rails upon which the cars rolled, thus bridging the gap.

Ledo Road lifeline across rain-swollen rivers. It had taken some of Mussolini's discarded, rusted steam locomotives out of bomb-pitted yards and put them to work in Italy. It had transformed an Iranian railroad known as "the Shah's toy" into a major supply route for rushing arms to the harried Russians.

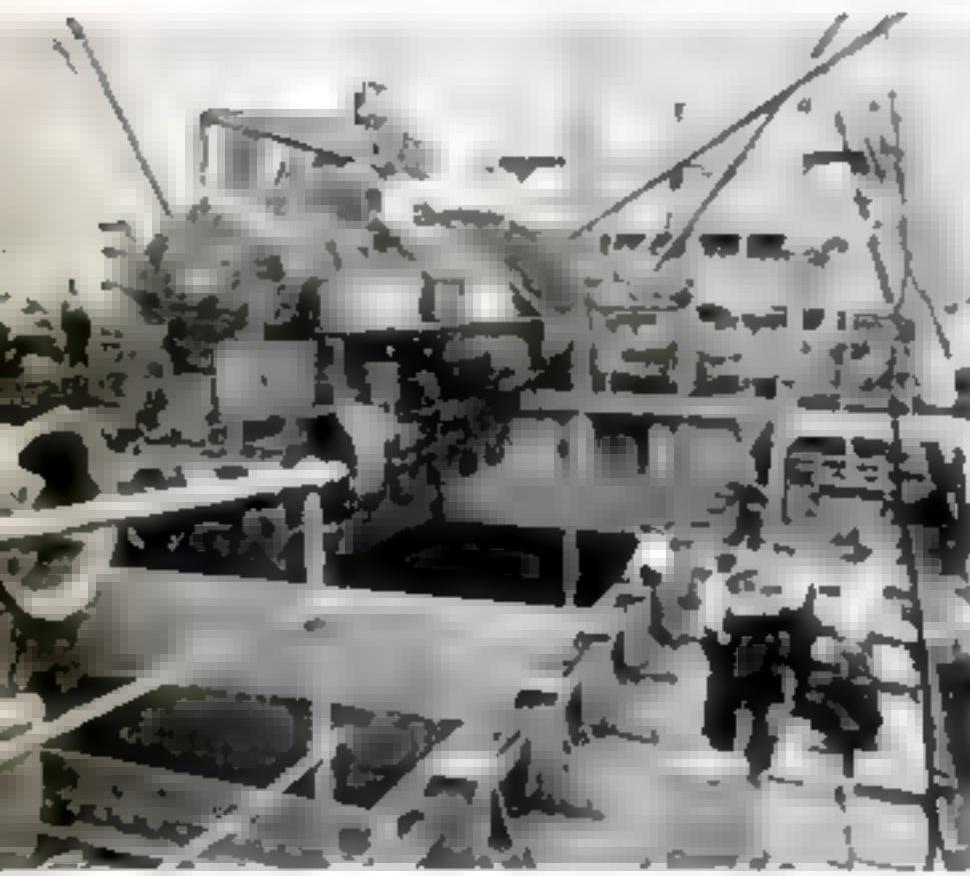

The United States Army knew, as all armies know, that you can't fight continental wars without railroads. That is why the rolling stock and rail centers of the enemy are A-1 priority targets of both tactical and strategic air forces. That is why 42,000 men and 2,000 officers were recruited from America's great civilian army of railroaders for World War II. That is why American

locomotive manufacturers, who turned out only 91 main-line units in 1940, began working around the clock after the Japs struck Pearl Harbor. The United States became the United Nations' railroad arsenal.

America's war of the rails began in Egypt in 1942. The British needed help. Rommel was knocking on the door to the Suez for an ultimate junction with the Japanese pressing from the east.

Every time an Egyptian locomotive chuffed, its steam and smoke drew fire from a German strafing plane. So the United States supplied Diesel-electrics to the British. It did more. It sent over the 760th Diesel Shop Battalion to keep those locomotives working. The British put their new

HOW LOCOMOTIVES ARE CARRIED ACROSS THE SEA

1 With a special grapple fastened to the front and top of a boiler, a locomotive is eased into the hold of a ship by crane. Heretofore, loading crews had to wrap cables around the engines' fat bellies.

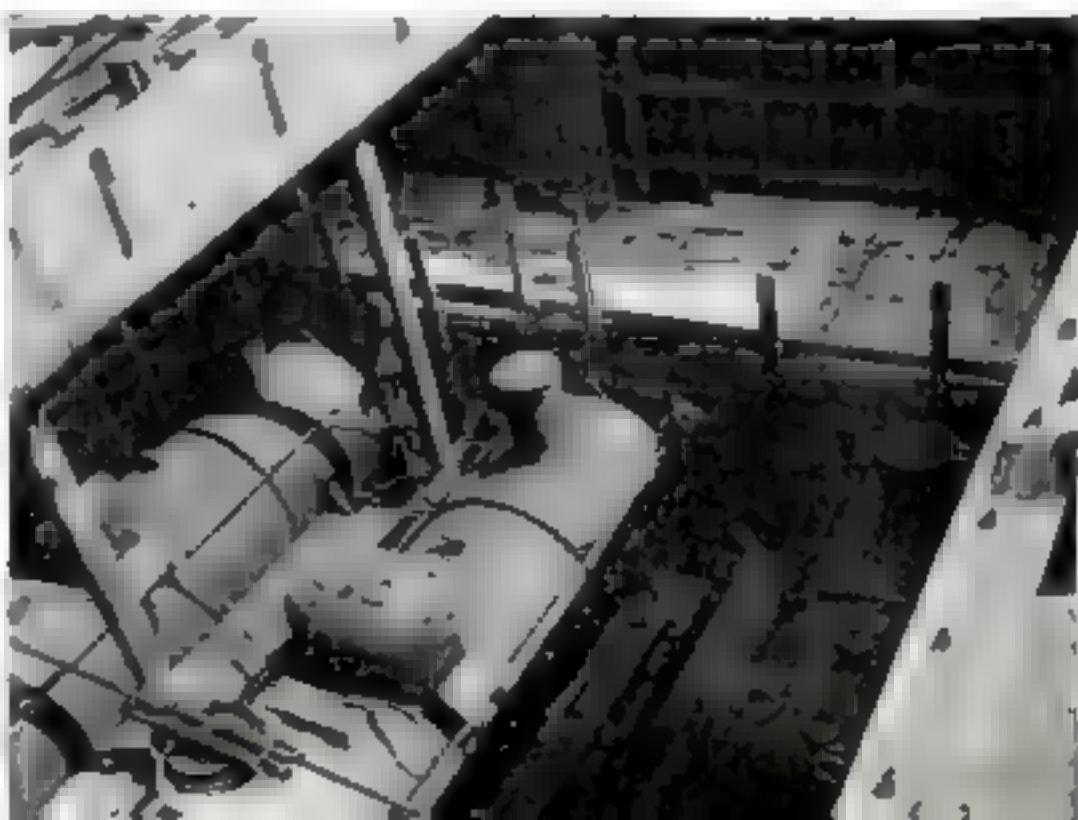

2 All snugged in for the long sea journey. An American-made locomotive—manufactured in quantity for transporting men and supplies to combat areas—is berthed in a hold. Rails in foreground are ready for more

3 In a ship's hold, the locomotive is welded to its rails to make sure the multi-ton cargo won't shift in transit. The lead pigs are insurance against any loosening of the tracks in stormy weather

4 A locomotive gone loco in a storm-tossed ship might easily stove a hole in the hull. So lead pigs are loaded between the bulkheads and wood barricades hard against the engine's snout to keep it rigidly in place

CARS AND ENGINES MUST FIT TRACKS ALL OVER THE WORLD

A difficulty that faced U.S. manufacturers building equipment for United Nations railways was international variation in road gauges. The Canadian-built monster above was made for the Indian State Railway and has a 66-inch gauge. A narrow-gauge line, like the one at right on New Caledonia, has a 36-inch spread. Russian rails are 60 inches apart, while in the "standard-gauge" countries it is 56½.

locomotives in the middle of trains where German airmen seldom could distinguish them from the boxcars—or, as Europeans put it, the wagons.

At Naples the MRS plodded into the line of fire to undo damage done by the Germans. German demolition work had been typically thorough. Rails looked like pretzels. Locomotive boilers were sieves. A device designed with diabolical cunning had ripped up untold miles of ties.

The Italians shrugged and said no one could make a railroad out of that debris. The British rubbed their chins and said it would take weeks.

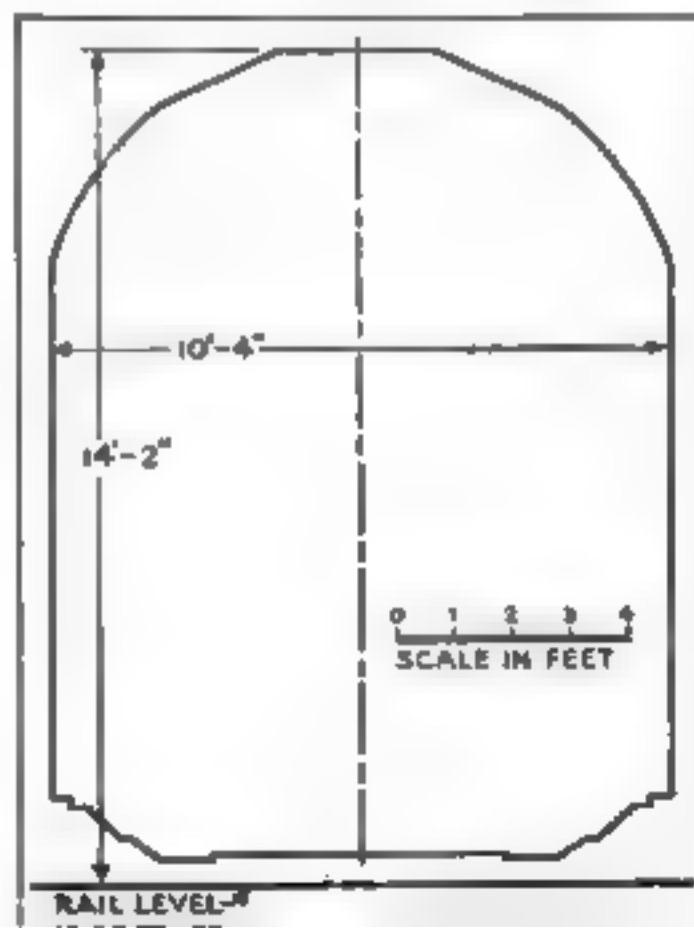

Five days after the American railroaders walked ashore, they had a railroad running!

That job was less complicated than the one they undertook in the mountain-ridden little kingdom of Iran. There had been built "the Shah's toy," a railroad that started nowhere and ended nowhere. Riza Shah Pahlevi, the country's Cossack ruler, had sunk \$100,000,000 in it. It snaked up from the Persian Gulf at 65 feet below sea level, in temperatures running to 130 degrees, into the bitter cold of the Elbruz and Luristan mountains. It threaded through 225 tunnels before it reached the capital, Teheran. From Teheran the railroad splayed out to the Northwest and northeast. All told, it had 1,500 miles of roadbed, all single-tracked.

The Russians needed that railroad. In

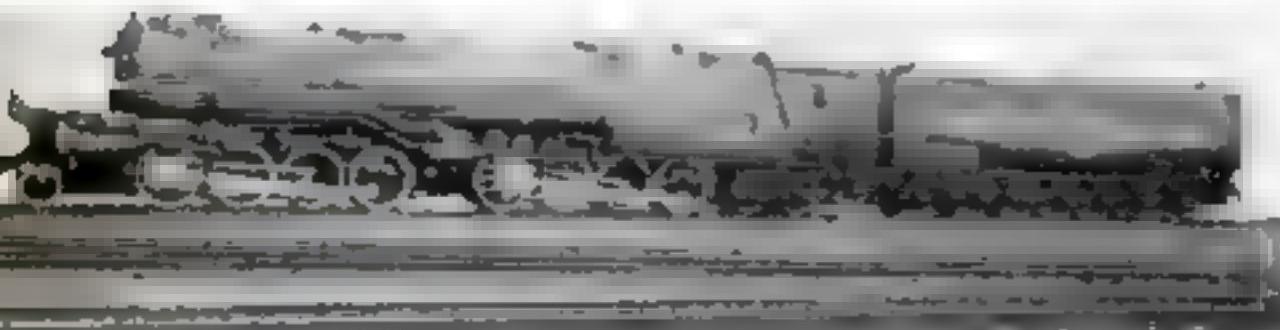

CLEARANCE. To make certain that rolling stock manufactured for European war fronts would clear tunnels, bridge structures, and station platforms, U.S. factories built to the dimensions of the "Bern clearance diagram" (below) covering most of the Continental railways

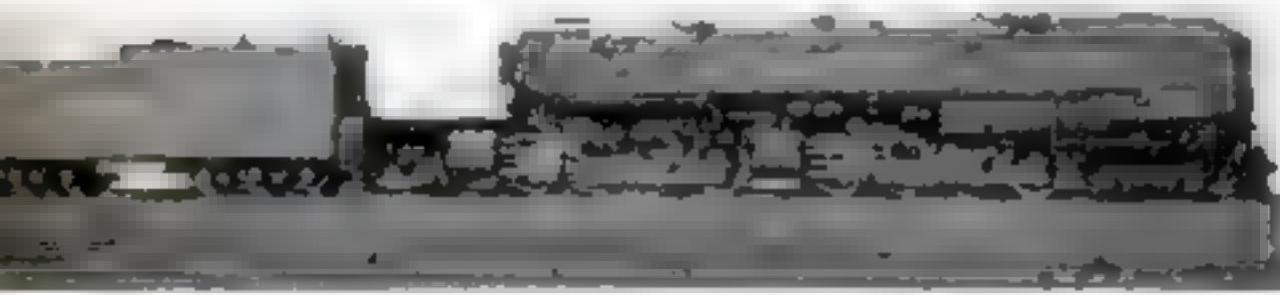

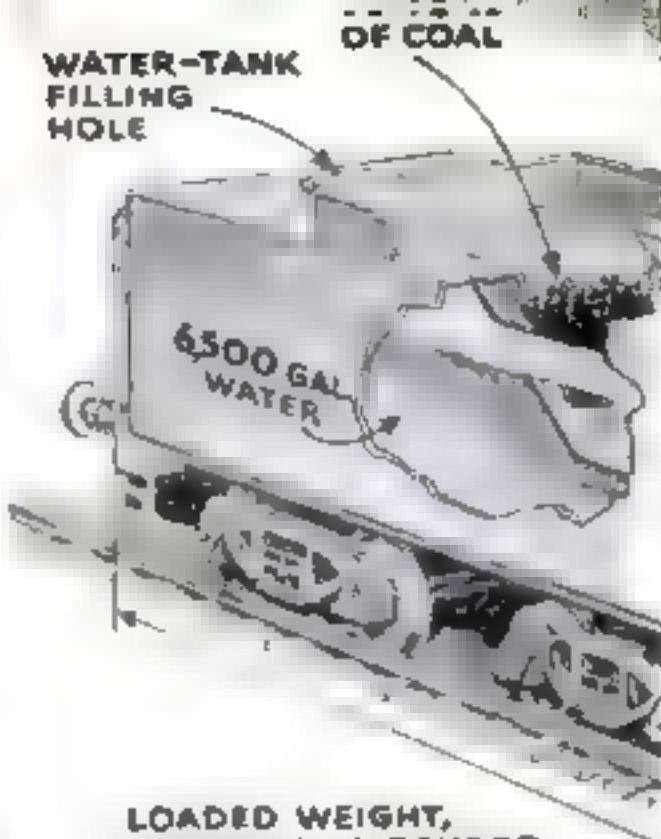

2-8-0. A variation on the 2-8-0, built by the American Locomotive Co. for the War Department is this engine, which has a rear truck under its cab

2-8-4. One of the world's most powerful freight locomotives is the 2-8-4 (16 driving wheels), constructed for the job of hauling great loads of iron ore from the mines of Northern Minnesota to ports on Lake Superior

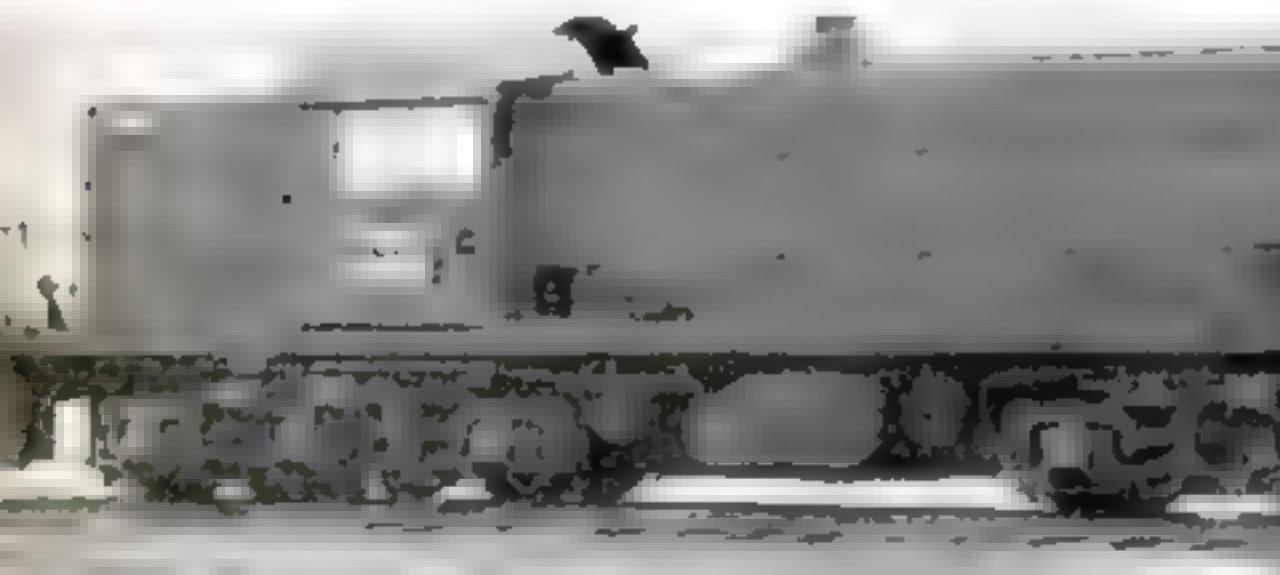

4-8-8-2. Another 16-driver locomotive, built by Baldwin, is the 4-8-8-2. The "4" in this instance stands for the number of wheels under the cab, as the 657,900-pound giant travels stern first to give clear visibility and freedom from gases in tunnels and snowsheds on the Southern Pacific

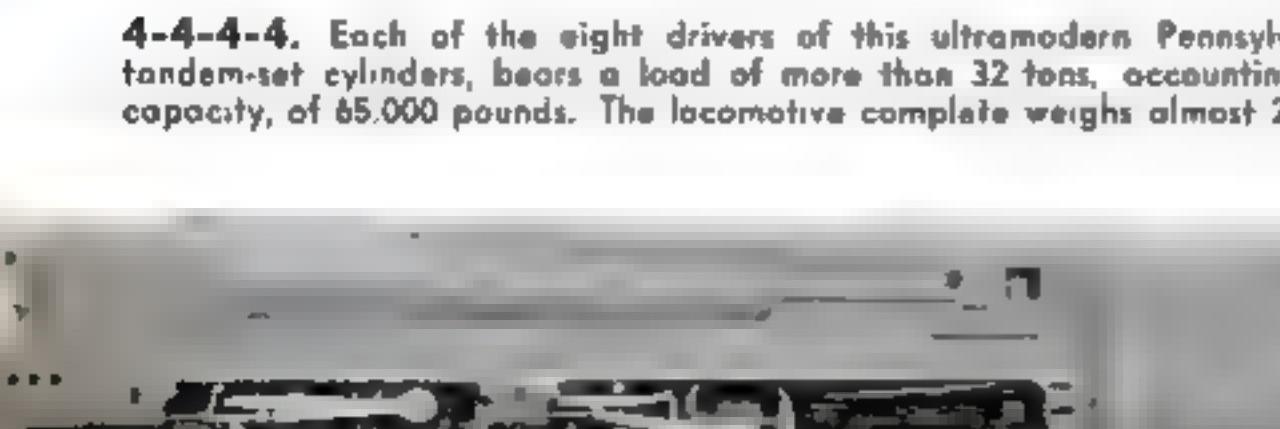

LOADED WEIGHT,
ENGINE AND TENDER,
276,500 LB.

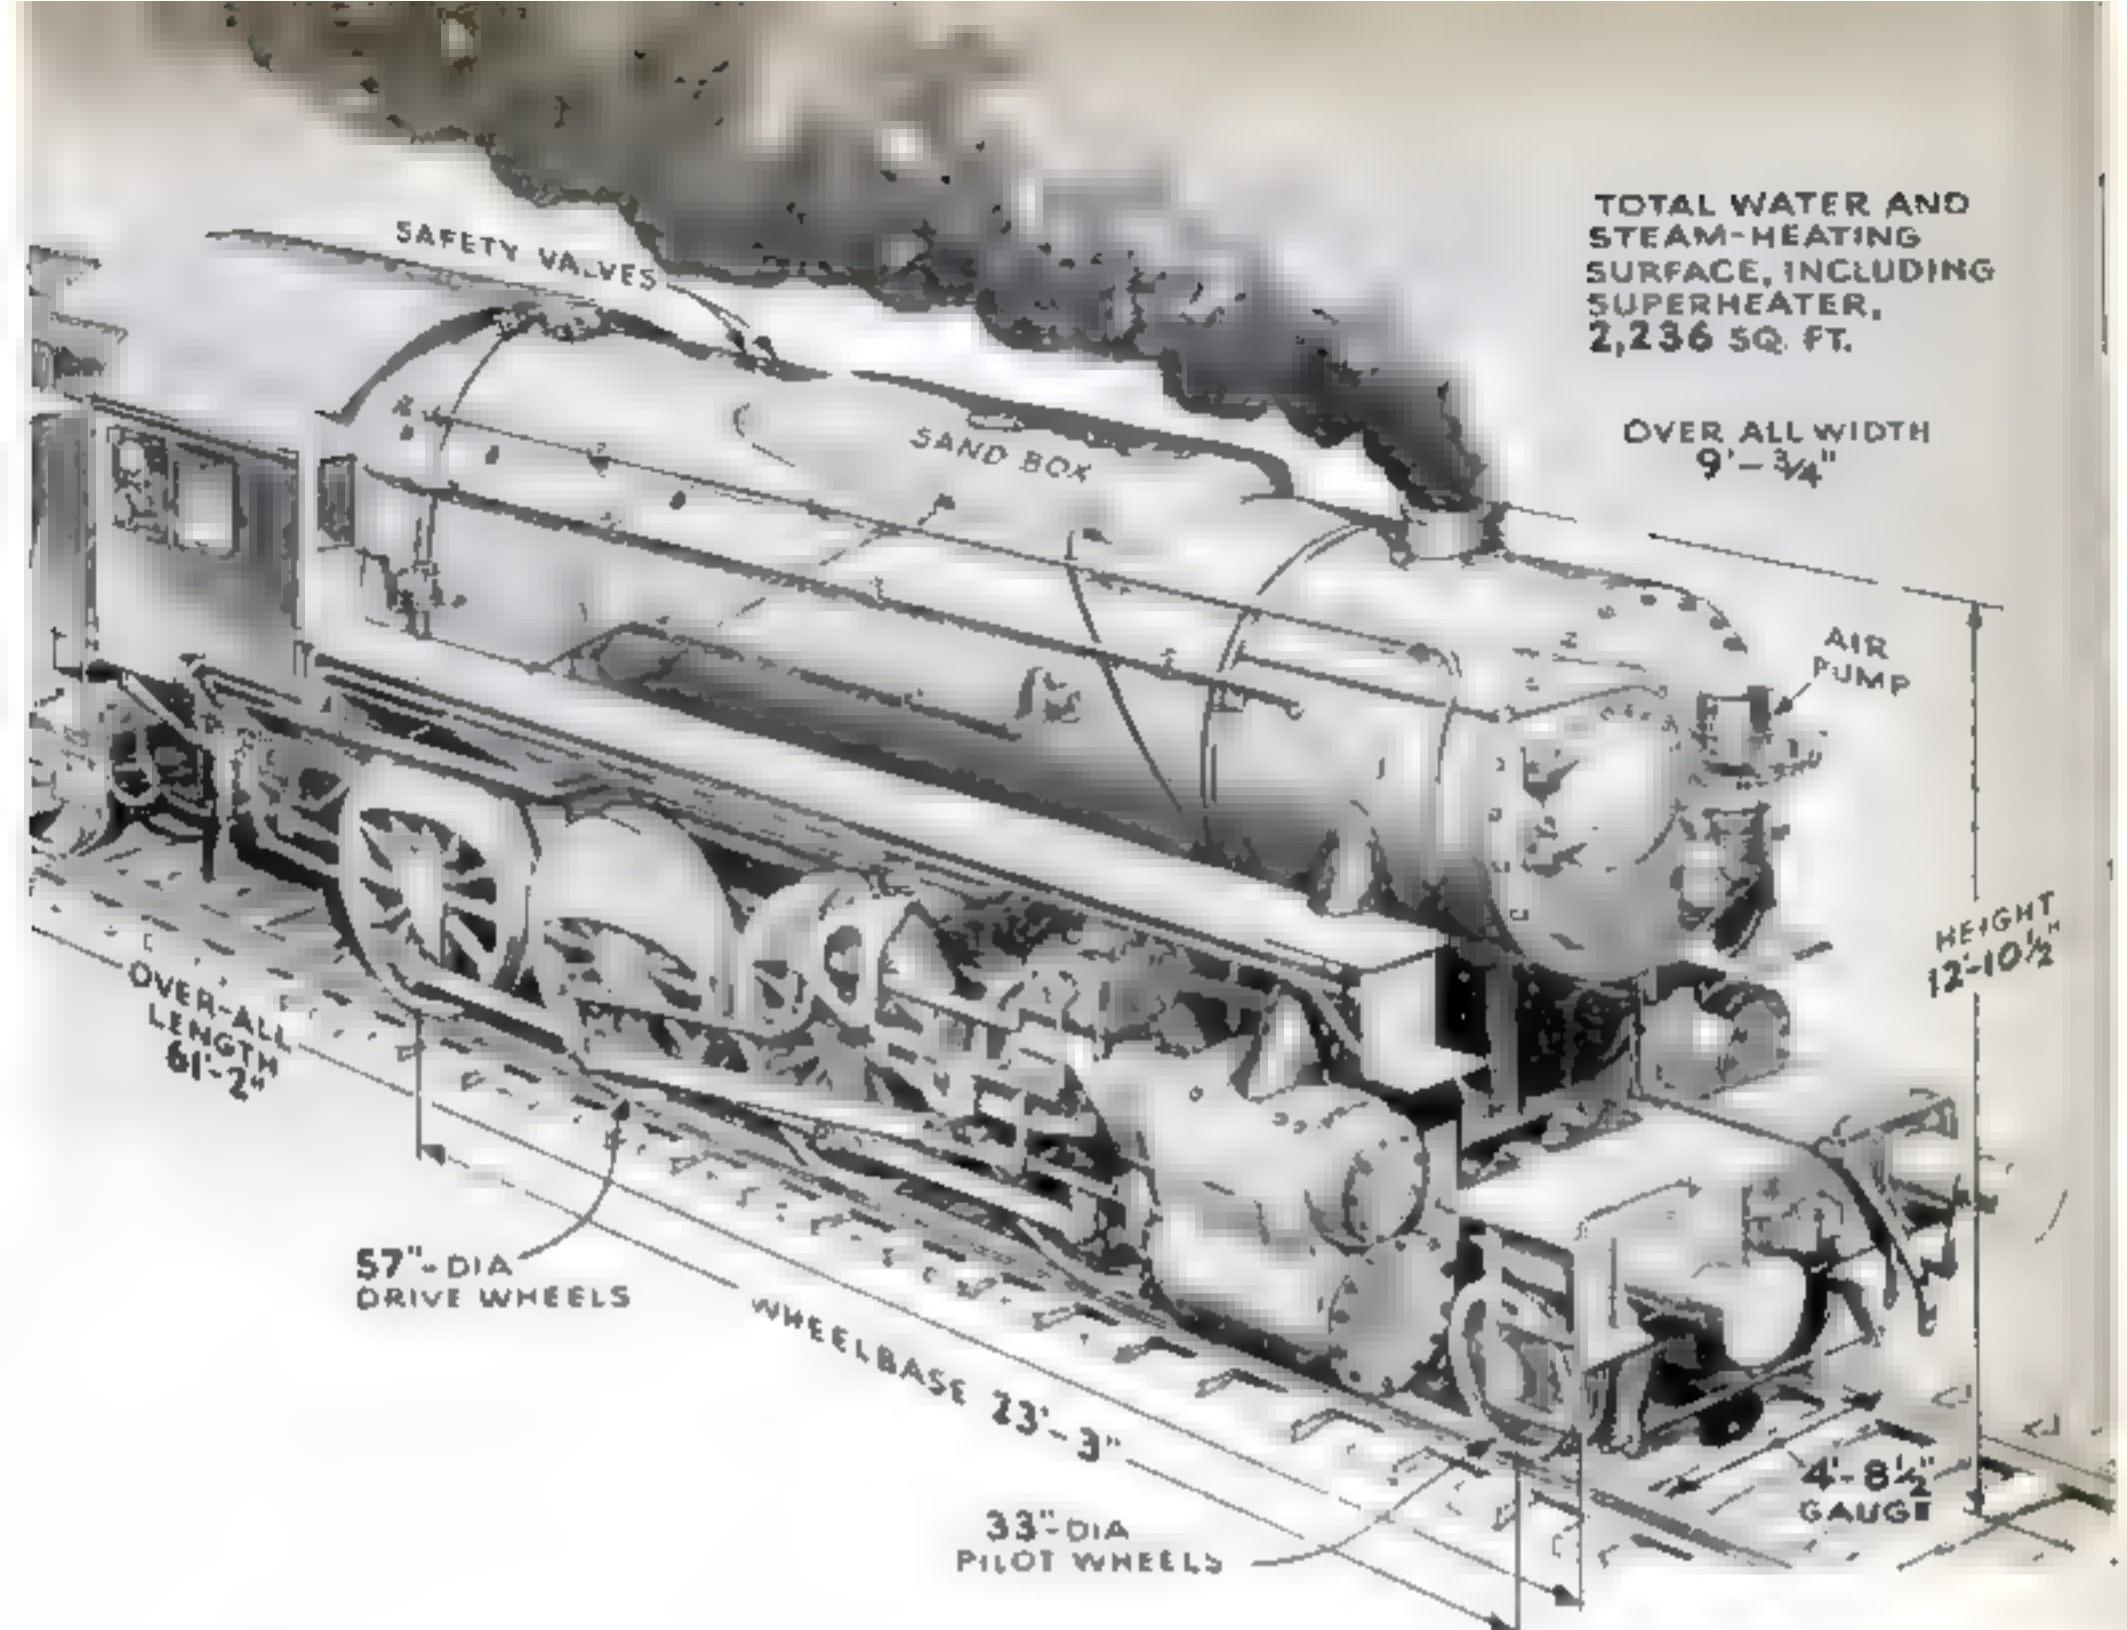

2-8-0. A drawing of the famous locomotive turned out in huge quantities by U.S. makers for war work abroad. Locomotive types are designated by numbers, referring to the count of wheels in the front truck, the driving wheels, and the wheels under the cab (in this case none, hence the "0"). Without its eight-wheeled, 22-foot tender, the 2-8-0 weighs between 60 and 70 tons and is 36 feet long

1,000-HP. DIESEL. This engine was especially designed with 12 driving wheels instead of the usual eight, so as to distribute its 254,000 pounds more evenly on the rails of distant Iran. The roadbeds on "the Shah's toy," as the 1,500-mile-long line is called, weren't built to take a heavier load per wheel

4-4-4-4. Each of the eight drivers of this ultramodern Pennsylvania steam locomotive, driven by tandem-set cylinders, bears a load of more than 32 tons, accounting for its tractive force, or pulling capacity, of 65,000 pounds. The locomotive complete weighs almost 250 tons without its mammoth tender

the very critical days of early 1943, the MRS moved in. It found that the British and American locomotives in use were not powerful enough to negotiate a roadbed with hairpin turns at a speed necessary to meet the Russian target of supply at the Caspian Sea. It found that the Persian Gulf port would not accommodate the deep-draft ships streaming over from America.

A fleet of Diesel-electrics—"streetcars," in railroad slang—was ordered. A hundred miles of new line was built from a whistle stop called Awaz to a better port at Khorramshahr. By May "the Shah's toy" was

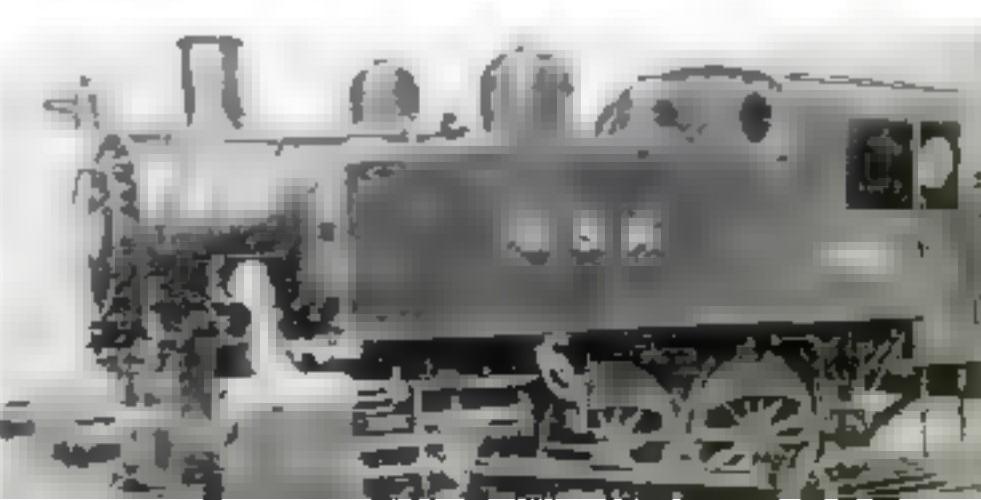

delivering 18 percent more tonnage than the Russians had specified, notwithstanding the fact that natives complicated operations by stealing the oiled stuffing out of journal boxes to make camp fires.

The Normandy operation was something else. Never in a major war had rolling stock been landed on a shore where the enemy stood at the battlements.

That is where a man named Sidney H. Bingham comes in. In peacetime Bingham ran the New York subways. Emphatic, imaginative, he was put into a uniform with Transportation Corps insignia on his lapels

2-10-0. A huge locomotive of a type built for Russia rolls out of the shop to be knocked down and shipped. It has a 60-inch gauge

SWITCH ENGINE. The stubby tugboat on rails is used chiefly at ports by Military Railway Service

CABOOSE. Somewhat different from the domestic type, this end car is built on Continental lines. The slits that look like ports are observation holes for the benefit of the crewmen, who like to see the scenery

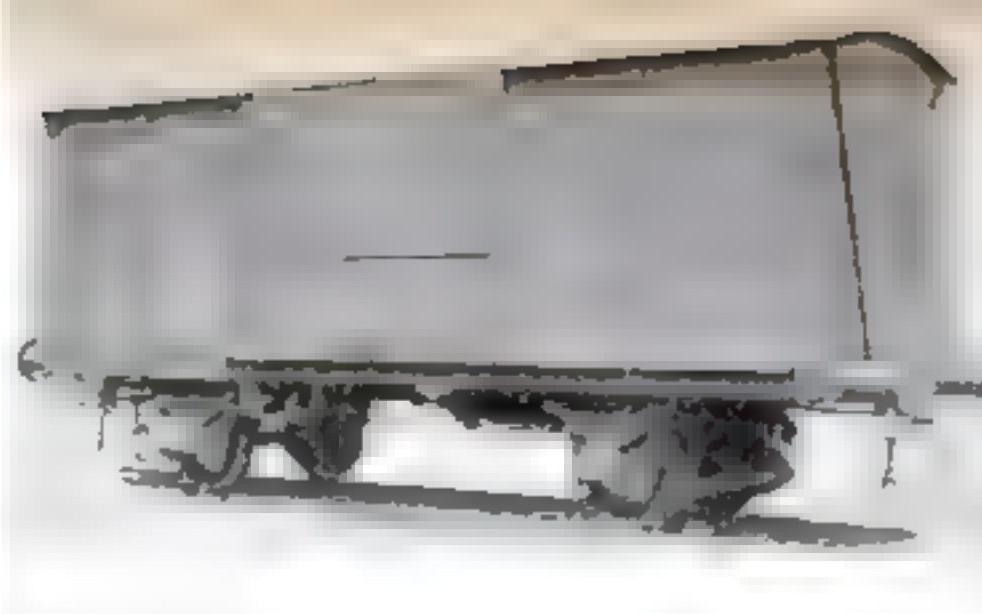

and assigned to planning railway operations for the invasion.

The Military Railway Service had collected the rolling stock for the job. By ordinary means it would take $3\frac{1}{2}$ years to get those locomotives and cars to France, even without German interference. That was as fast as they could be shuttled over in the train-carrying ships the British used in trans-Channel work before the war. Moreover, the British ships would need docks for unloading.

Sitting on a joint British-American board, Bingham, a colonel, made a suggestion: Why not load this stuff into U. S. Navy LST's (landing ships, tank) and roll it across the beaches? The LST's had little or no draft, and he would figure out some way to get the cars and a few Diesel locomotives off the boats.

Somebody in the room snorted. That 24-foot tide would allow just 90 minutes out of each 24 hours for unloading on a beach, granting the stuff could be unloaded on a beach.

This was in July, 1942. Colonel Bingham ignored the snort and set to work. Experimentally he laid tracks in an LST. Then he

BOXCAR. This is the standard 20-ton boxcar constructed by American Car and Foundry for foreign service. It runs around 24 feet in length, stands about 11 feet in height, and has a door on either side

loaded rolling stock in it and sailed into rough water to see whether the boat would behave properly. It would.

Now for the big problem. He laid a "breathing bridge" in quick-setting concrete on an English beach at low tide, fitted a wheeled ramp to the lip of the LST's cargo deck, and rolled his cars ashore regardless of the tide level.

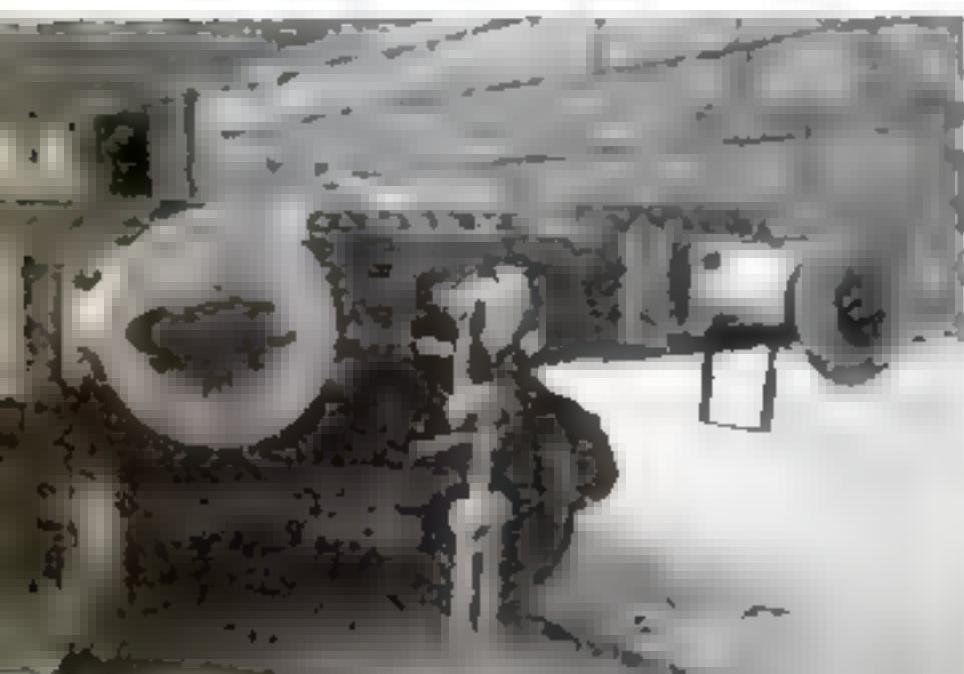

Nobody snorted.

On D-day plus 25 Col. Bingham put down four "breathing bridges" on a Normandy beach at low tide. Thirteen days later he started pushing converted LST's across the 100 miles of open water to the Cherbourg peninsula. Each boat carried 22 cars. It took him exactly 26 minutes to load in England and exactly 21 minutes to unload in France. He knew. He timed it.

By mid-October, aided by some of the Cherbourg docks slowly coming back into use after the usual Nazi destruction, he had delivered a total of 20,000 cars and 1,300 locomotives.

This seeming delay in delivering the big locomotives was part of the plan. Gen. Bernard Montgomery stated flatly that he would have no steam locomotives in his area of

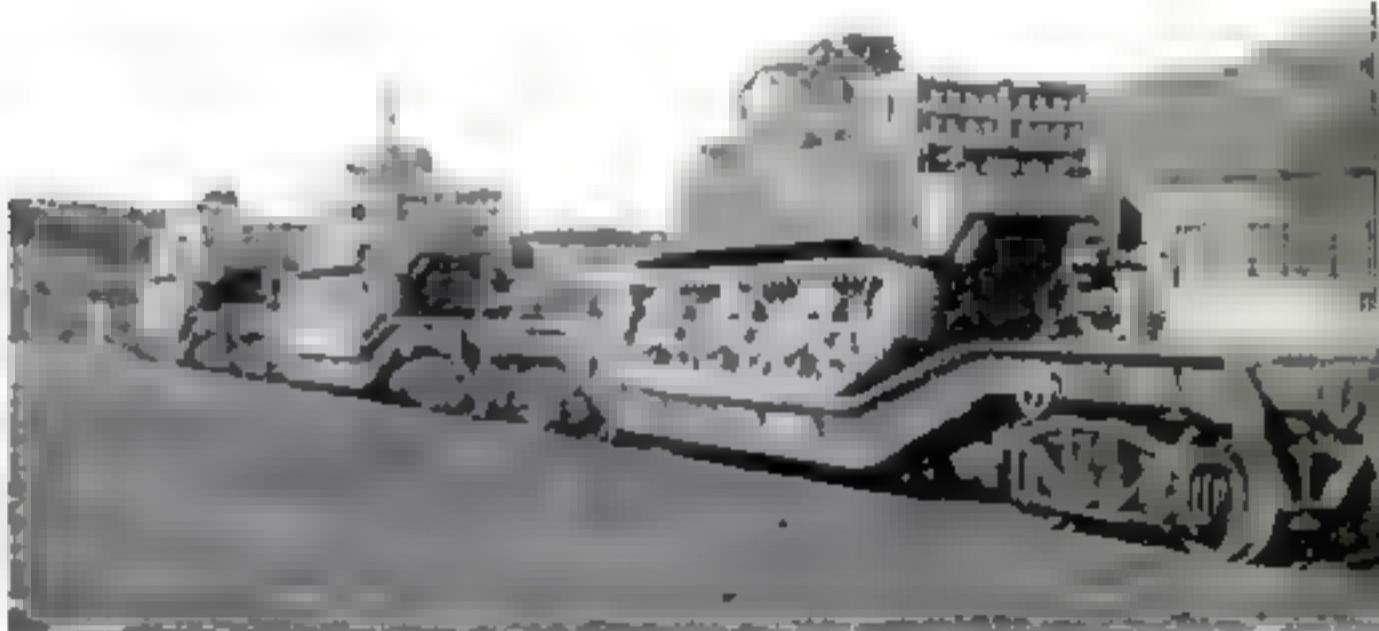

EUROPEAN COUPLERS. American car and locomotive manufacturers were forced to build their equipment to European standards when we first became the railroad arsenal of the United Nations. Couplings, for instance, are of the screw type. The platelike projecting faces are buffers, backed by springs, that absorb the shock as rolling stock jounces back and forth during a trip. In America we use a coupler which is automatic and simple, and serves the same purpose. In addition, the U. S. lines have a standard coupling height of $3\frac{1}{2}$ inches, while on the continent it may run as low as 20 inches

SELF-PROPELLED WRECKER. Railroad wreckage left by Allied strafing planes and German demolition has to be cleared quickly. So we have sent large numbers of these Diesel-propelled wrecking cranes overseas to lend a hand in keeping 'em running

TANK CARRIERS. Developed to meet a specific war demand, these special-bed flatcars conform snugly to the outline of General Grant tanks, holding them securely en route to battle fronts. Known as Barnell cars, some of them are shown at an ordnance depot in England

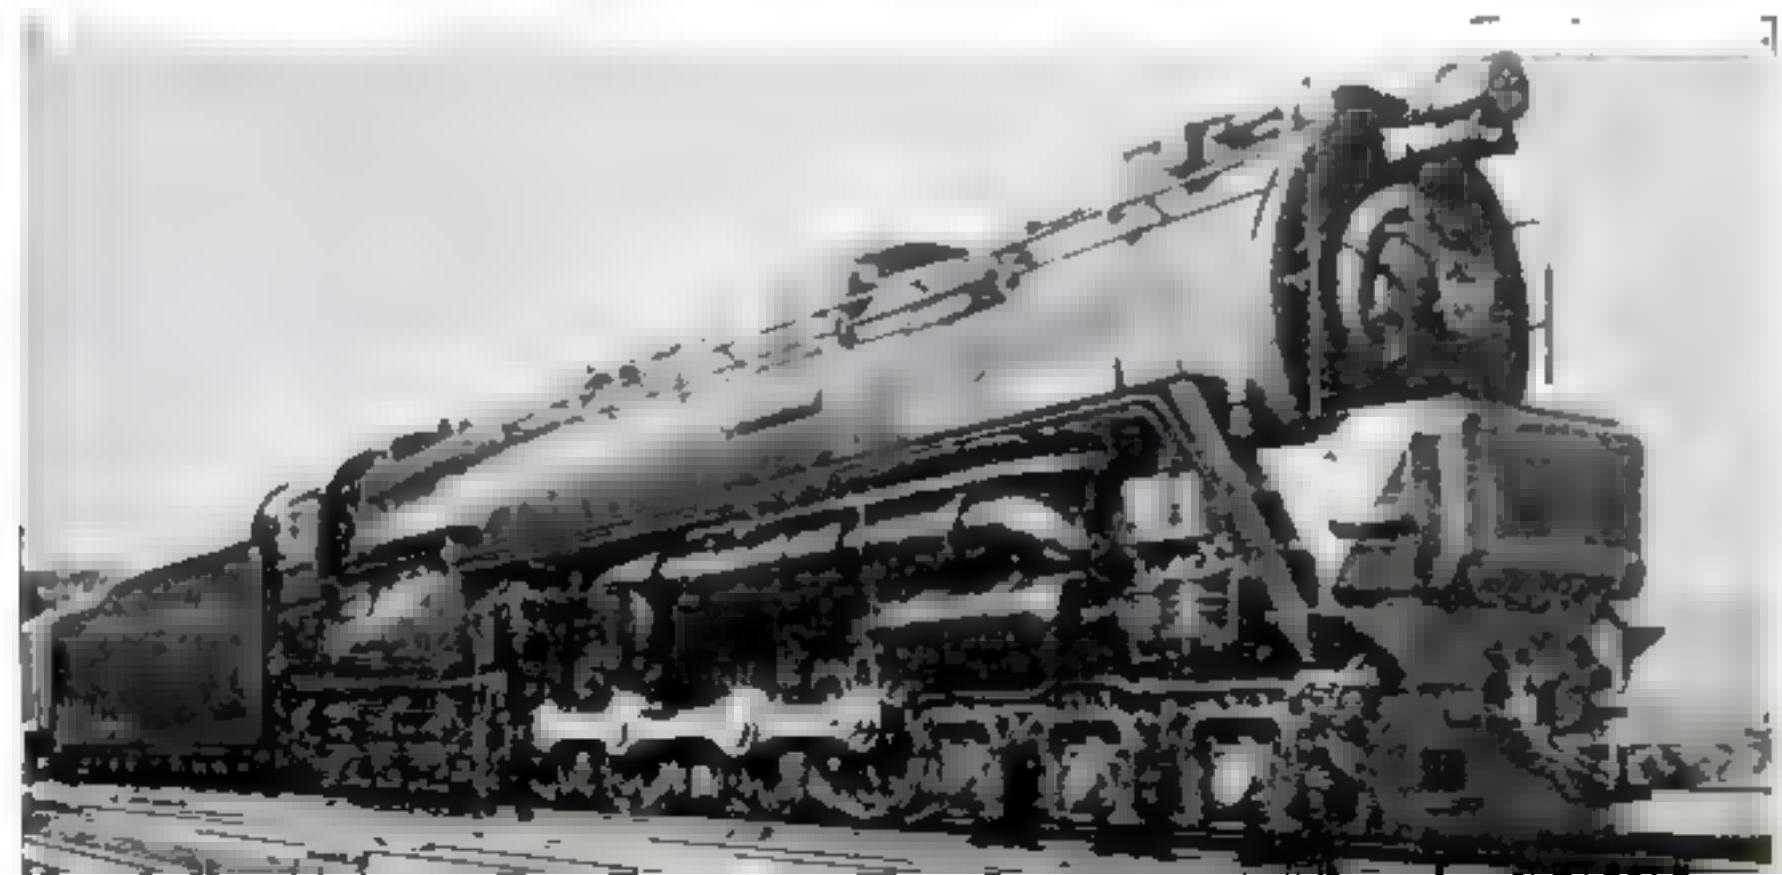

operations during the first critical weeks. The railroad crews, he complained, were always right up behind the front lines, and the smoke and steam made targets for enemy artillery. So they used Diesels.

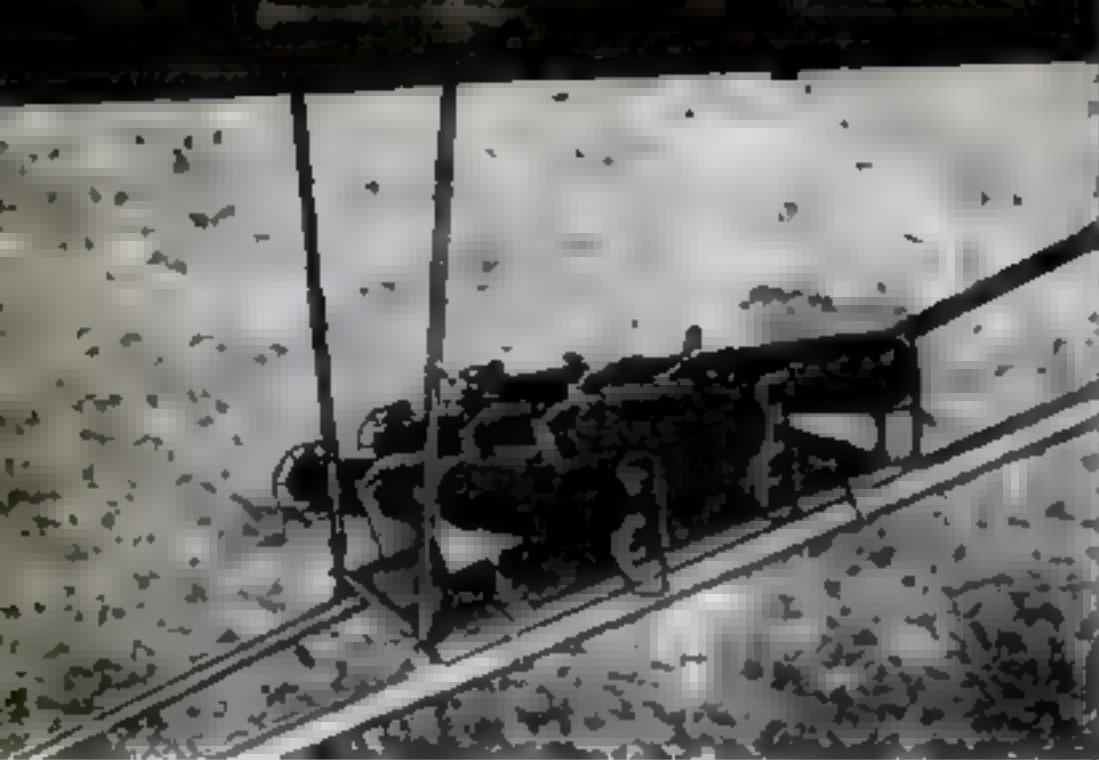

The Second Battle of France could not have been fought without the Transportation Corps' cars and locomotives. Of the 80,000 locomotives the French railroads normally operated, less than 4,000 were found

and most of these were in very bad shape.

The campaign in France lent eloquent testimony to the role of the railroad in war. In the 81 days that the "Red Ball Express," the truck supply route between Normandy and Paris, operated while the French rail lines were being refurbished, it toted a half million tons of supplies. That much is being carried every 23 days now by the rails supplying the front. (Continued on page 820)

LOCOMOTIVE OF TOMORROW? The war has brought about an acceleration in the development of the locomotive, as it has in so many other technical fields. This Pennsylvania Railroad mammoth may be a foretaste of the future. It is powered by a steam turbine instead of pistons, cylinders, and driving rods. The engine and tender have a combined weight of almost 500 tons and an overall length of 123 feet

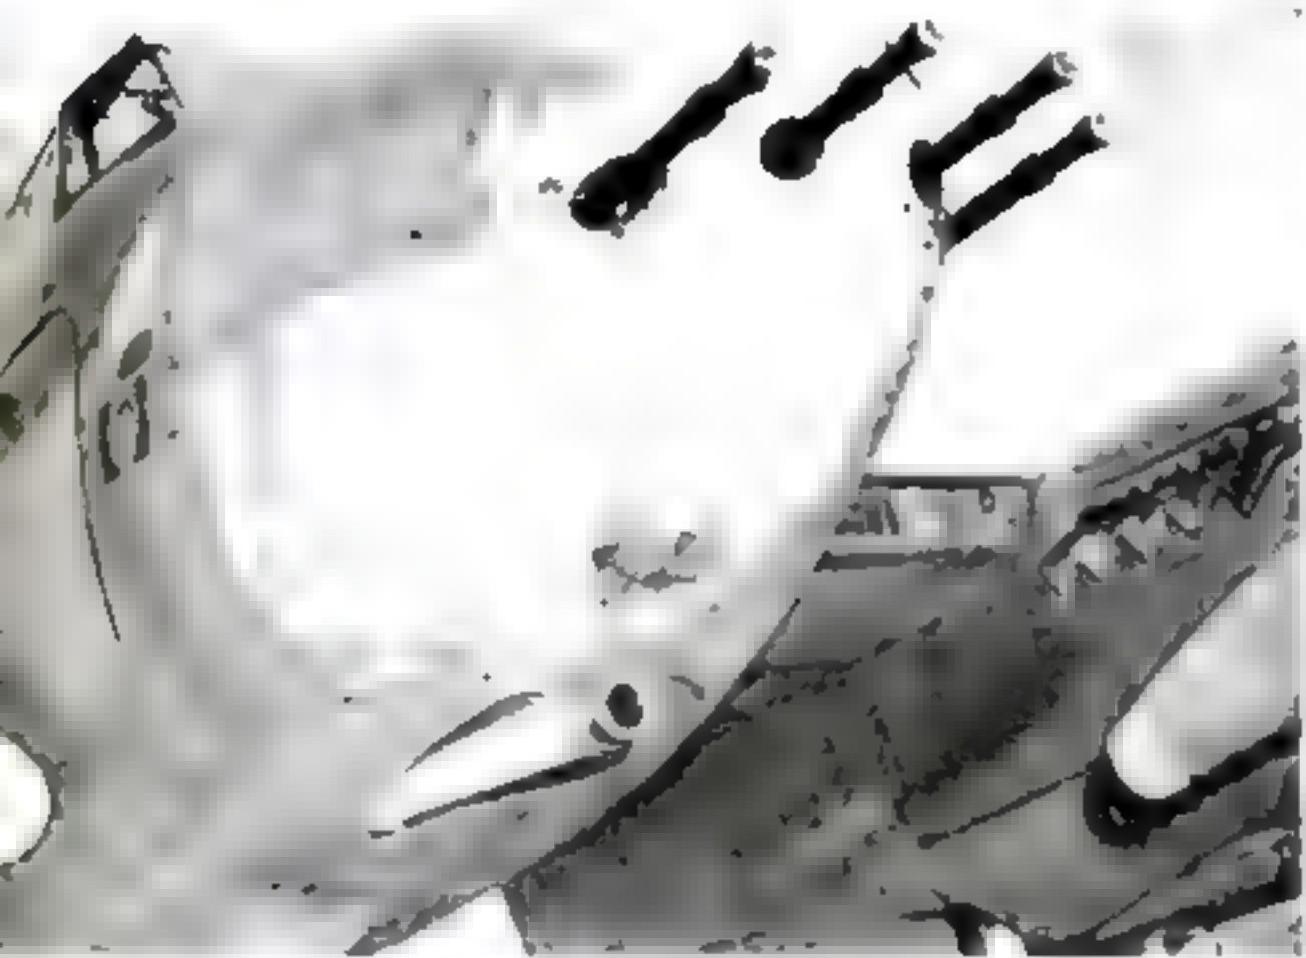

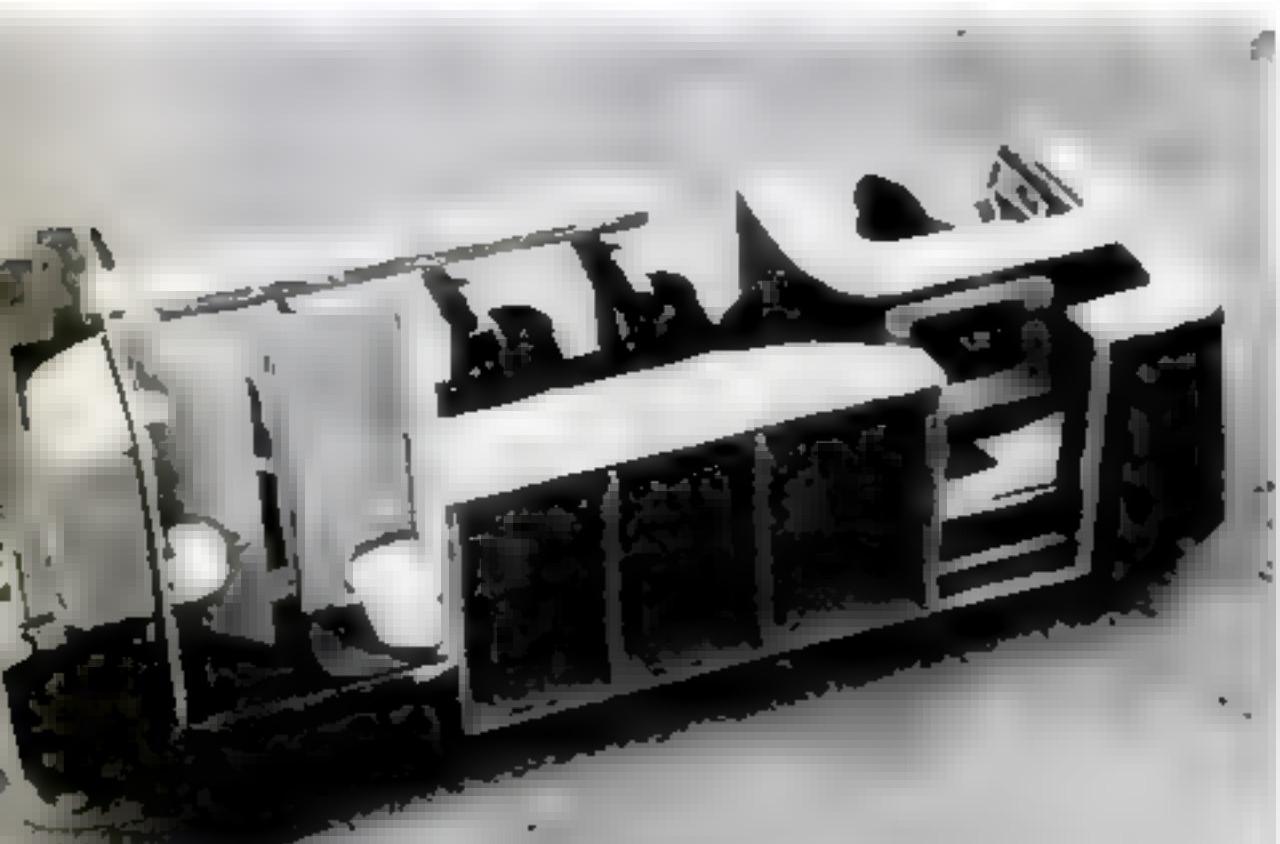

PIPER CUB TANK BUSTER. Maj. Charlie Carpenter, of the Armored Command, got tired of seeing enemy tanks scurrying around below while he spotted artillery hits from his "grasshopper" plane. So, with the assistance of the Ninth Air Force Service Command and an associate in Ordnance, he equipped the Cub with bazookas, and went

to work on the Germans. Under each of the wings was mounted a battery of three of the weapons, loaded and ready for firing by means of a cord pulled by the pilot. The prey was sized up from a high altitude, and, since the enemy believed that the pilot was concerned only with artillery spotting, they did not notice the bazookas inconspicuously located under his wings. When he had picked his target, he spiraled down and swooped in just above the treetops for the kill.

The first day, Carpenter knocked out one Tiger tank with each battery, and the latest available report shows his total to be 14. The photograph at the left is a muzzle-end view showing how three of the rocket hurlers are mounted on the struts of a Piper Cub. All three bazookas on one side are fired by a jerk on a lanyard, shaking the little ship like a fever chill.

NEW WALLOP is carried by latest version of the British Mosquito, the Mark XVIII, which carries a six-pounder that pokes out its muzzle from beneath the nose and fires a shot every second. The new cannon has been so effective against U-boats that the Germans have had to adopt new tactics. Its accuracy was proved when a Mosquito pilot, attacked by 12 JU-88's, blew one of them to pieces at a one-mile range. The six-pounder is about the equivalent of the 75-millimeter gun carried by our B-25 Mitchell bomber. In addition to this, the Mark XVIII carries four .303 machine guns.

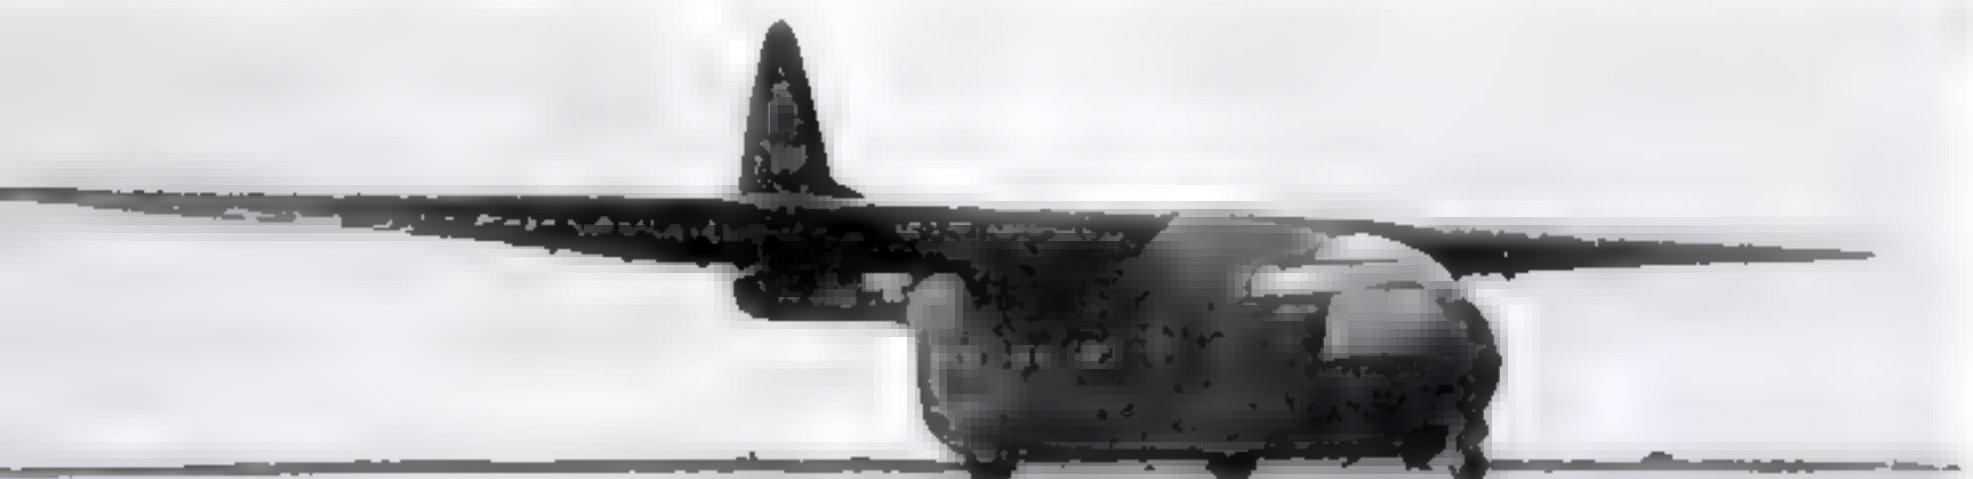

EFFICIENCY BUS has been designed by Oliver L. Parks, manager of Parks Air Transport, Inc., of East St. Louis, Ill., to carry passengers from hotel to feeder-airline plane. It is equipped with baggage compartments, a floor scale to register passengers' weights, a telephone that can be plugged in at the terminals, a two-way radio, and a toilet room with hot and cold running water. (Model shown here has its roof and sides removed.)

15,000TH FIGHTER to be turned out by the Curtiss-Wright Corp. for the United Nations, this P-40 Warhawk wears the insignia of the 28 Allied air forces in which Cur-

tiss-built fighters have served. Prominently displayed are the markings of Maj. Gen. Claire Chennault's Flying Tigers, with which the P-40's won undying fame in China.

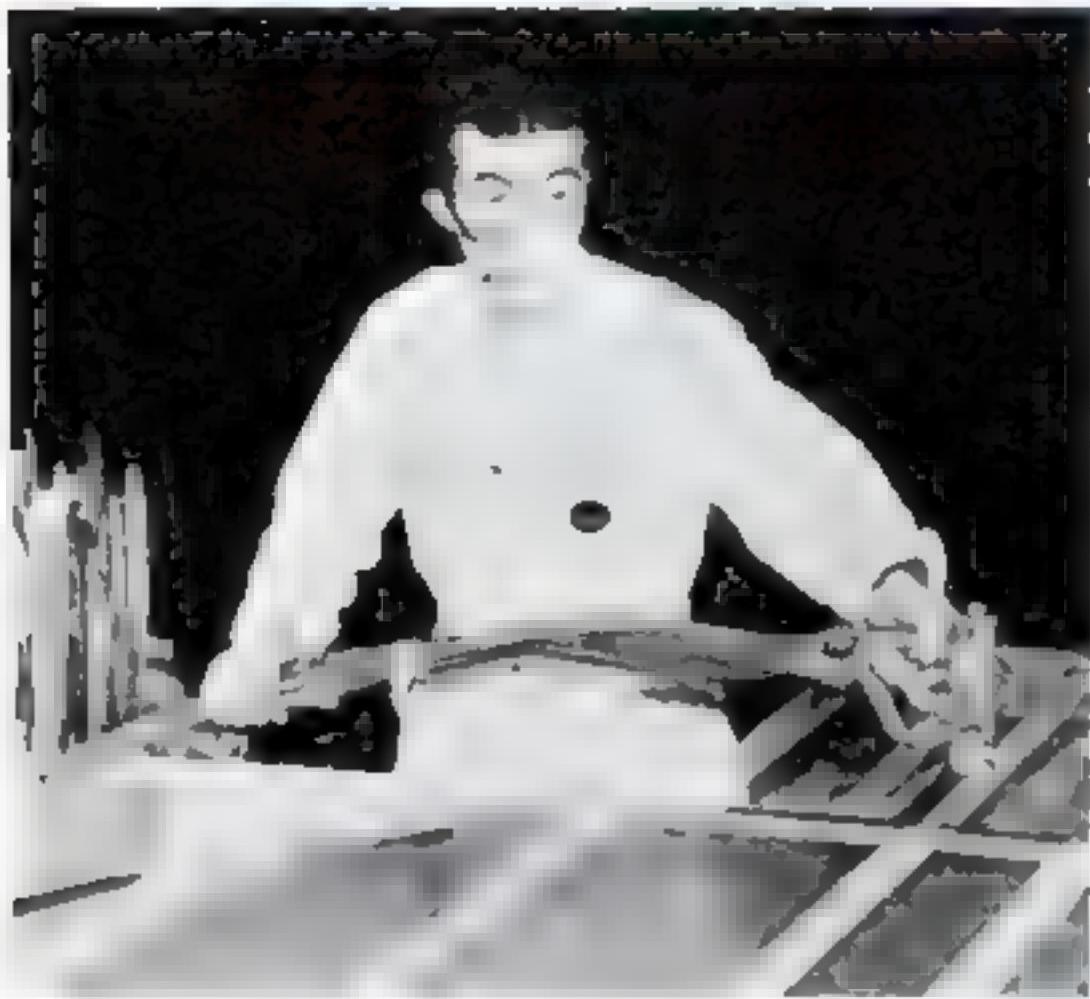

GIANT GLIDER, CG-10A, can carry 42 fully armed men or six tons of freight. Designed and built by the Laister-Kauffman Aircraft Corp., St. Louis, Mo., it has a span of 105 feet, almost two feet greater than that of the Flying Fortress.

TWIN TAIL BOOMS were used for the first time in U.S. gliders in the CG-16, shown below. Craft was designed by Hawley Bowlus, Los Angeles, Calif., and built by General Airborne Transport, Inc. Span is 91 feet 9 inches.

— March of Science —

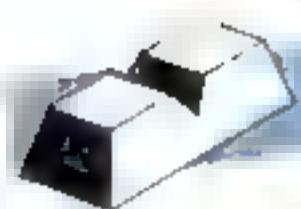

INDUSTRY

THINNING LACQUER WITH HEAT now obviates mixing it with expensive thinners, to bring it to just the right consistency for application with a spray gun. Wartime use of the process speeds coating of gilders and light plywood planes with airplane "dope," as at left, by reducing the required number of coats from seven to three. A major postwar field, foreseen for the method by the Sherwin-Williams Company, whose laboratories developed it, will be tougher finishes for automobiles and household appliances.

NATURAL HISTORY

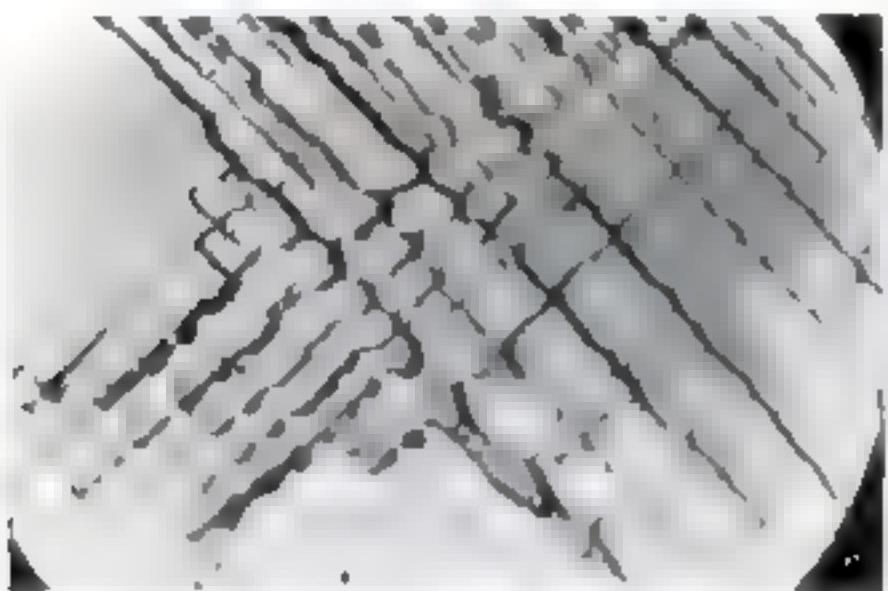

RUBBER FISH are replacing stuffed ones in museum exhibits. Cast in plaster-of-Paris molds of fresh specimens, the substitutes preserve every detail, with the advantage over mounted skins that the body does not shrink, nor do fins become brittle. At left, Ralph C. Morrill, Yale University taxidermist who devised the scheme, exhibits unfinished and painted rubber models. Even real skins require painting to restore faded natural colors.

METALLURGY

FRACTOGRAPHY. Odd patterns of broken metal fragments, studied for the first time under powerful micro-

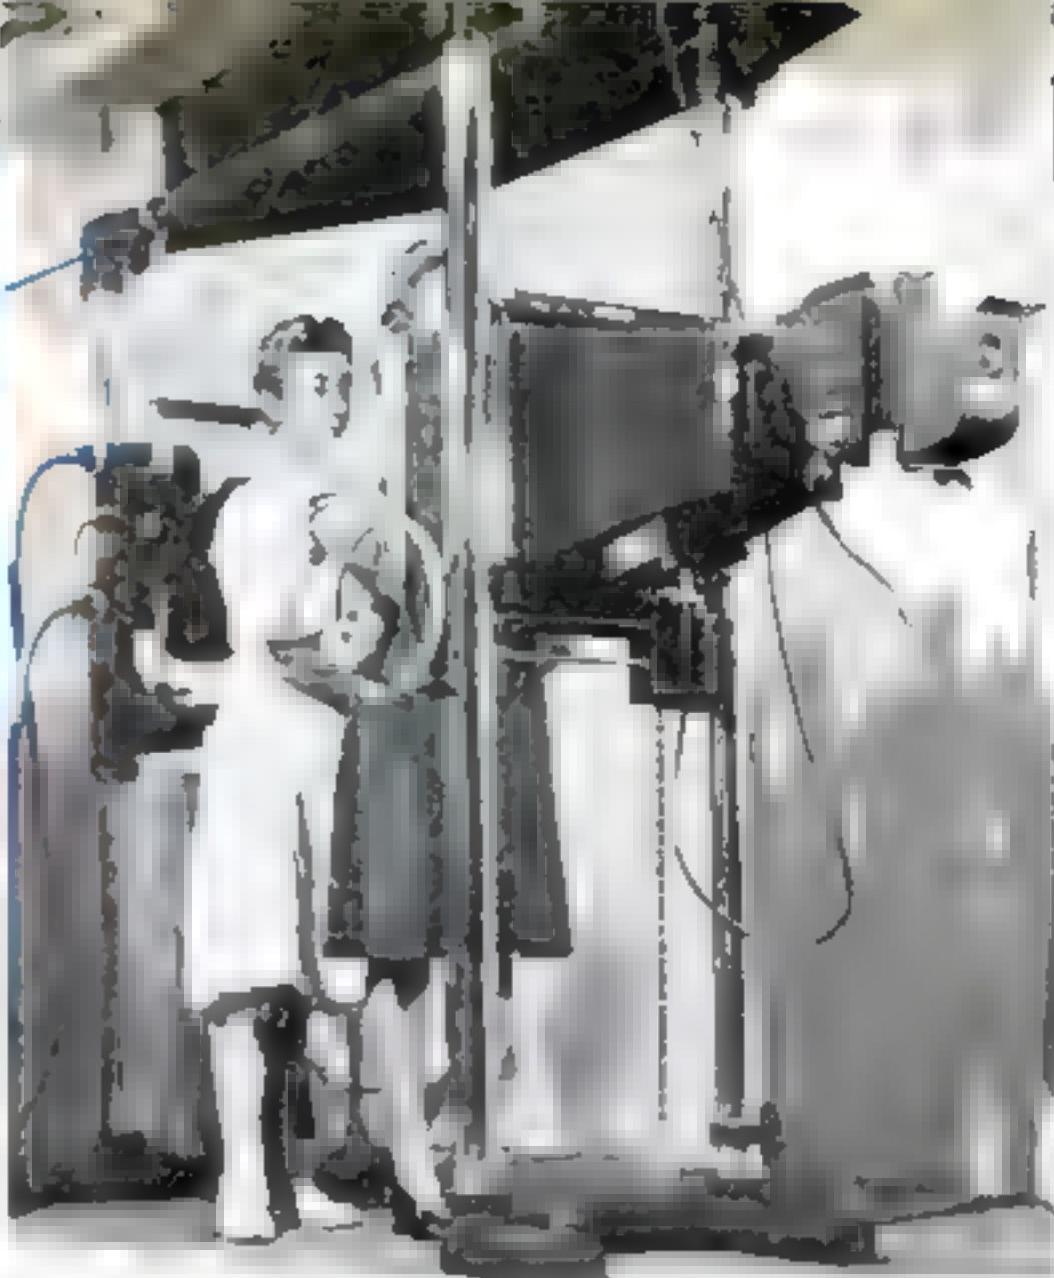

scopes, may yield new clues to reasons for strength, fatigue, and failure. Photos below show fractured 50-percent silicon-iron alloy, magnified 1,000 times. Familiar "terrace pattern" of facets at left contrasts with concentric circles at right, surrounding a foreign particle of silicon dioxide.

ELECTRONICS

X-RAY TUBERCULOSIS CHECK. An exposure meter for X-ray pictures, developed by Westinghouse engineers, automatically compensates for individual differences in body thickness and tissue density. Built into an outfit for examining industrial workers for signs of tuberculosis, it permits handling 1,000 subjects a day, twice the number previously possible. Consequent reduction in time off from work encourages progressive employers to arrange

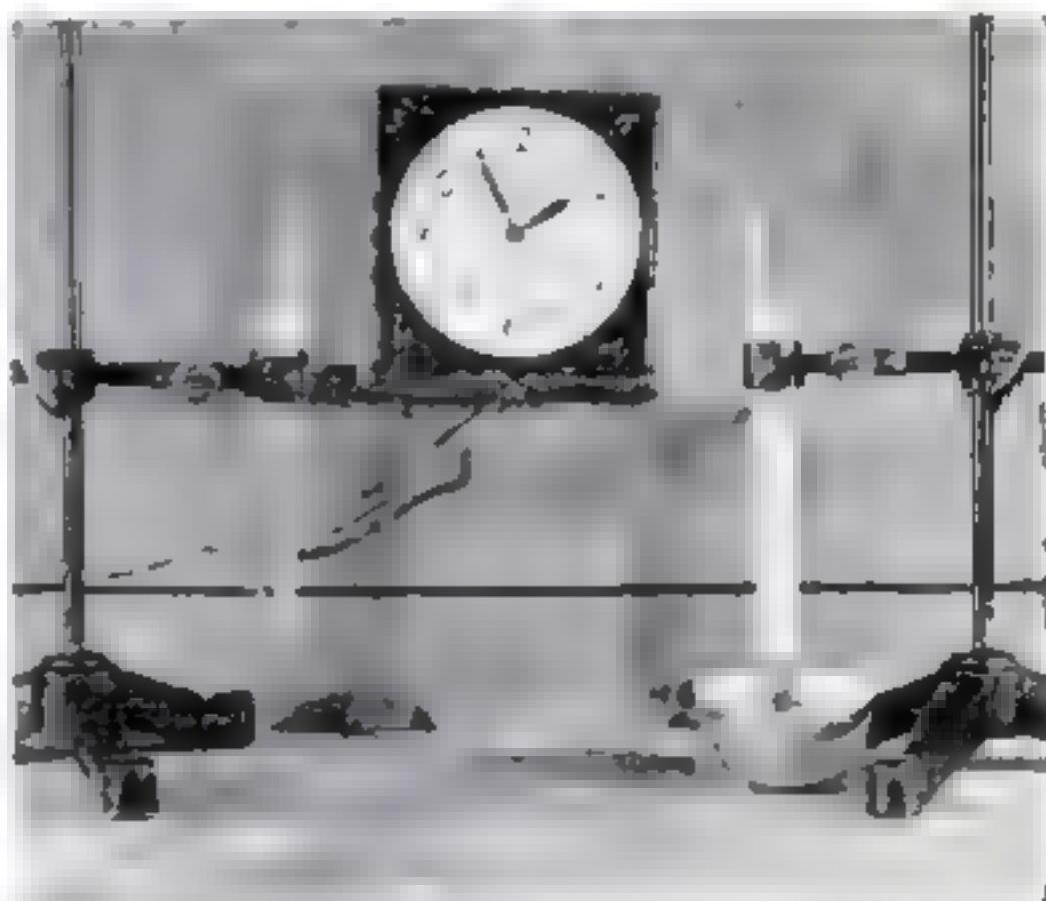

health examinations for their employees, to the mutual advantage of both. The X-rays frequently reveal unsuspected cases of "T.B." Photo and diagram above show the complete apparatus and how it works.

CHEMICAL-RESISTING GLASS that defies even hydrofluoric acid, which etches and dissolves ordinary glassware, has been announced by the American Optical Co., Southbridge, Mass. An immediate use will be in containers for the industrially important acid, which has hitherto had to be handled in vessels of platinum, lead, rubber, or paraffin. Other applications include safety goggles and helmets for chemical workers. Photo at lower left shows ordinary glass frosted, new glass clear, in windows of helmet brushed with hydrofluoric acid; at right, test tube of special glass is unaffected by the acid, while bottom of ordinary test tube has been eaten

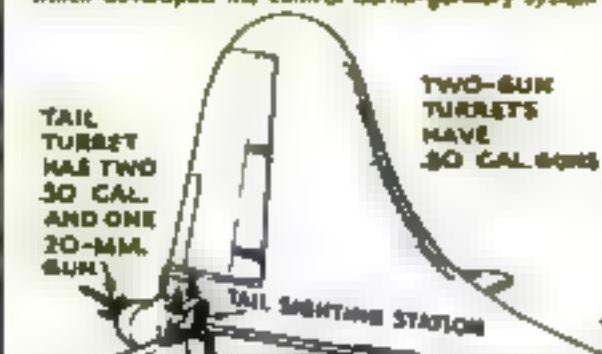

CHEMISTRY

through. To make the impervious product, a white powder called phosphorus pentoxide replaces sand in the conventional glass formula of sand, lime, and soda.

HOW NAZIS LAUNCH V-2 ROCKET

USING an RAF reconnaissance photo made over Peenemunde, Germany, as a guide, artist G. H. Davis drew these sketches for *The Illustrated London News* to show how the Nazis launch the terrifying V-2 rocket.

The bombs are stored, it is believed, in huge caves dug in hillsides and heavily reinforced. They are hauled to concrete firing platforms on big trailers and raised to an almost vertical position before being discharged.

THE TRUTH ABOUT JAPAN'S "MYSTERY SHIPS"

For months we asked, "Where is the Jap navy?" At last it has shown its hand. Here is an analysis of the enemy's seapower.

By ALDEN P. ARMAGNAC

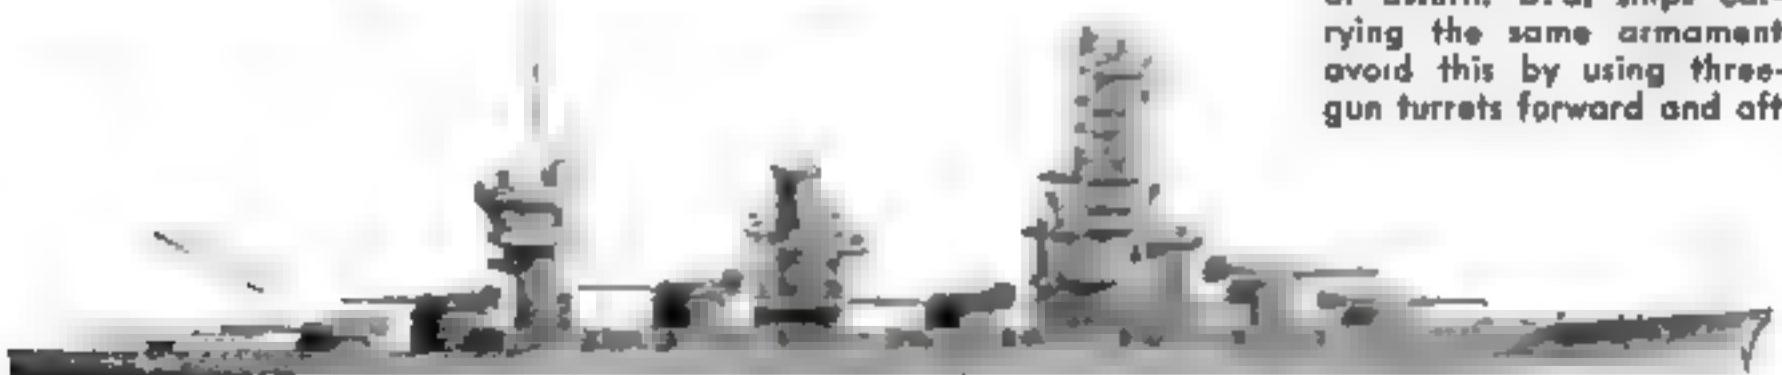

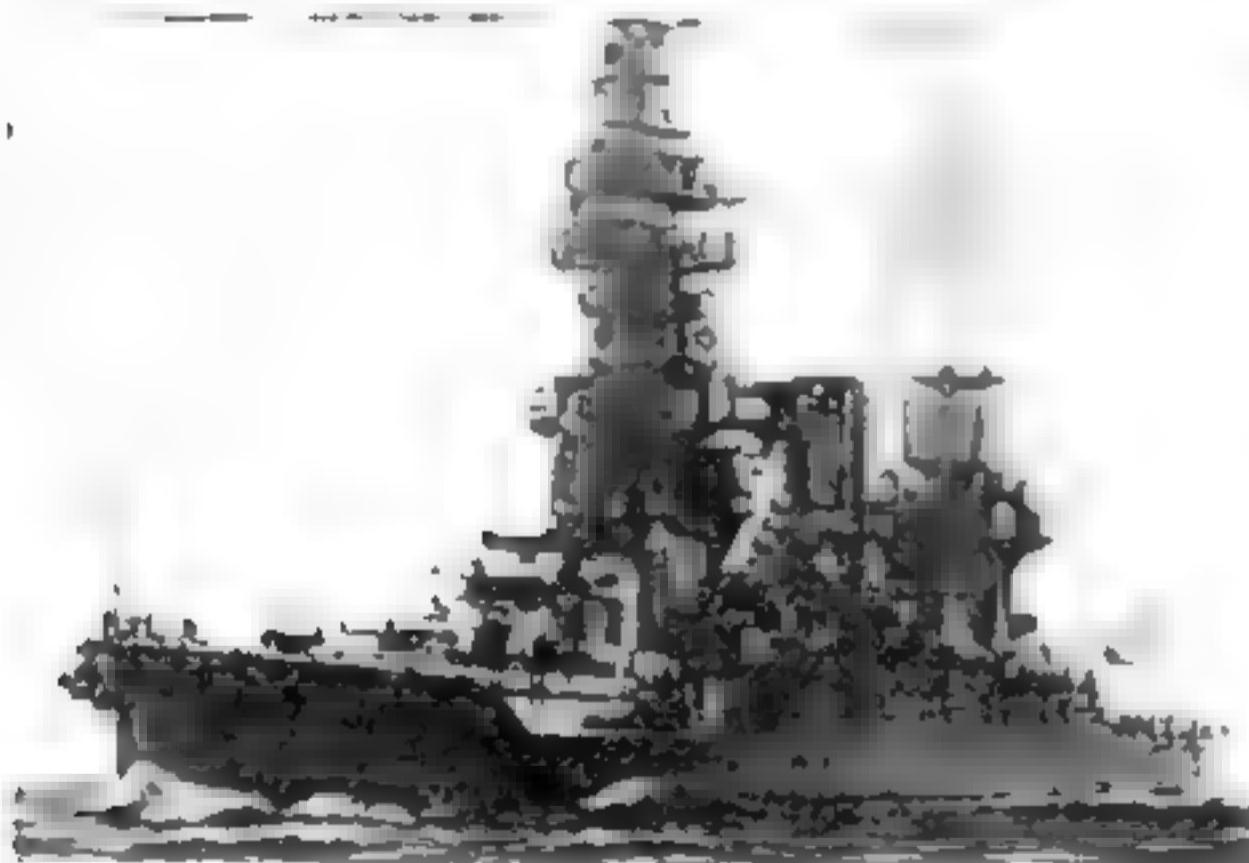

TAKING shape beneath concealing roofs of bamboo, in Japanese shipyards, warships of secret design have long inspired wild rumors. At last our advance across the Pacific has forced the mystery craft out of hiding. Now, for the first time, we know what our Navy has to lick—and that information will help it mightily to play its part in the combination of sea, land, and air-power pledged to the destruction of the Japanese Empire.

Illustrating the latest in Nipponese battle-

ships, the Yamato and Musashi first showed themselves in the Second Battle of the Philippines. A photograph snapped from a U. S. Navy plane, while bombs made a shambles of the Yamato's superstructure, enables any layman to analyze Japan's most powerful warship class.

Study of the picture indicates a vessel approaching the 45,000-ton size of our Iowa class—believed to be the only men-of-war in the world that outclass it, ship for ship. The Yamato mounts its main battery of nine big guns, probably 16-inchers, in the first triple turrets to be installed aboard Jap battle-

TWO JAP BATTLESHIPS THAT WILL NOT FIGHT AGAIN

FUSO is one of two enemy battleships known to have been sunk in the memorable Second Battle of the Philippines, when the Nipponese navy finally came out for a showdown—and got it. Note the pagoda-like superstructure, typical of all except the latest Jap battleships.

YAMASHIRO, a sister ship of the Fusō, also went to the bottom in the same engagement. The drawing below shows the arrangement of the twelve 14-inch guns in six two-gun turrets. The masked central turrets cannot fire directly forward or astern. U. S. ships carrying the same armament avoid this by using three-gun turrets forward and aft.

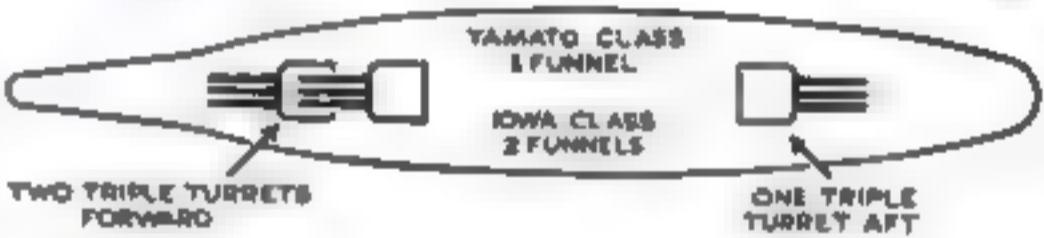

"MYSTERY SHIPS" MAKE FIRST APPEARANCE IN BATTLE

SECRET SUPERDREADNOUGHT. Pride of the Japanese navy, the 45,000-ton Yamato runs for its life under a terrific pounding by aerial bombs. We knew the Japs were building mammoth battleships like this, and the Philippines battle brought them out of hiding. Inset: silhouette of the Yamato class

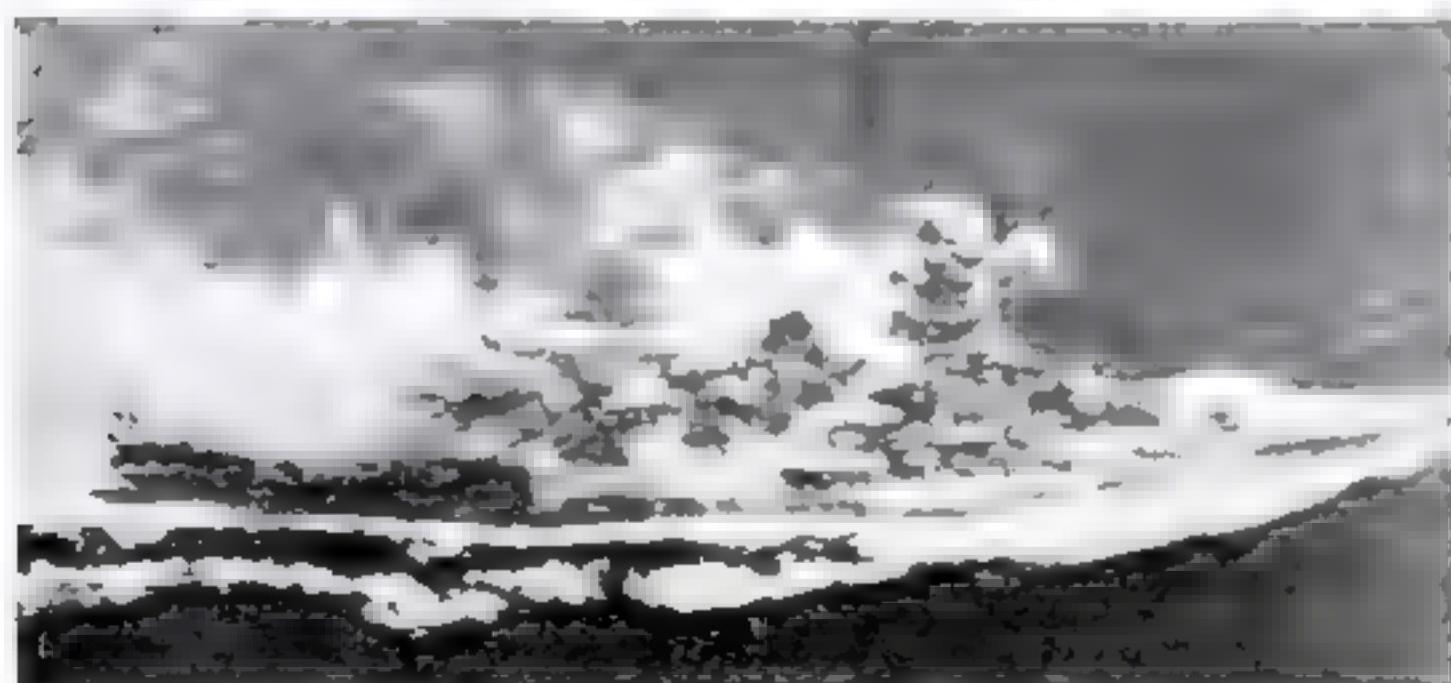

YAMATO vs. IOWA. Comparison reveals both similarities and differences. Our Iowa (above) has two funnels to Yamato's one, but general hull design and placing of big guns is the same, as shown at right (drawing not to scale)

wagons. As in standard American practice, two turrets have been placed forward and one aft—the latter all but obscured in the picture by smoke and wreckage. Since the battle, Fleet Admiral Chester W. Nimitz has announced that the *Musashi*, sister ship of the *Yamato*, is now definitely known to

have blown up and sunk as the result of damage inflicted on her by U.S. carrier planes in the same engagement.

Battleship-carriers, strangest of naval hybrids, have appeared in the converted Jap battleships *Ise* and *Hyuga*. The freak ships appear to combine the worst features of

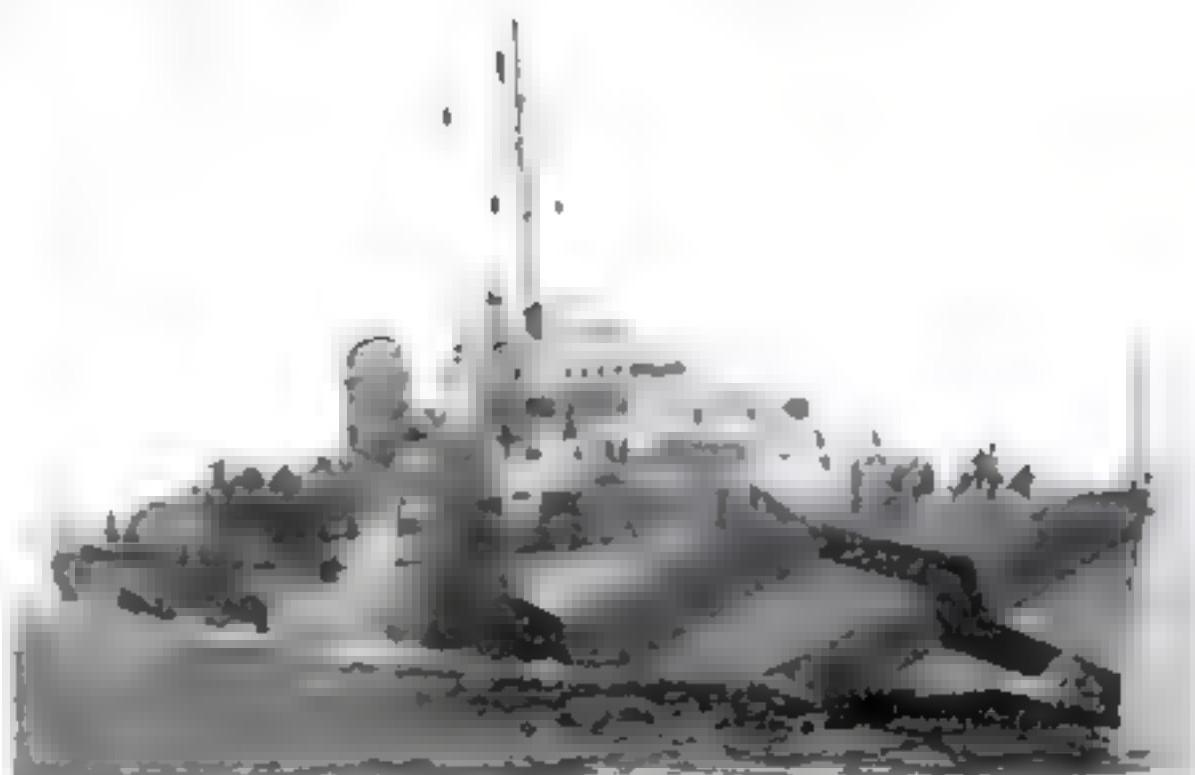

HYBRID Battleship and carrier in one, this freakish Jap man-of-war sacrificed two turrets to make room for a tiny "flight deck" aft. She is fleeing after bomb and torpedo hits by planes from U.S. carriers

NEW AND OLD TYPES OF WARCRAFT

both types. Each provides a "flight deck" aft, a fraction of the length of the smallest flattop and apparently suited only to catapult launchings. For the dubious advantage of the "carrier" feature, the two after turrets of each vessel evidently have been removed—a surprising sacrifice of firepower, which Japan can ill afford in her remaining capital ships.

From what we now know of Japan's tools of seapower, the opposing lineups for the Battle of Japan can now be estimated within reasonable limits. At most, Japan can probably muster no more than 11 battleships to our 23—a proportion of more than two to one in our favor. If the Land of the Rising Sun has another Yamato class battleship, as naval circles here believe, two of its capital ships are modern, compared with 10 of ours. These figures do not include our newly completed 27,000-ton *Alaska* and *Guam*, which the U. S. Navy calls "large cruisers"—a masterpiece of official understatement.

In other categories of fighting ships—carriers, cruisers, destroyers, submarines—the story again is one of overwhelming American superiority both in numbers and in types. Due for completion in 1945, the mammoth U. S. carriers *Coral Sea* and *Midway*, will match the 45,000-ton displacement of our mightiest battleships and will provide a take-off run long enough for the heaviest bombers ever launched at sea. They will dwarf even the 33,000-ton *Saratoga*, veteran of our carrier forces, and the 13 or more *Essex*-type carriers of more than 25,000-ton size that we have completed since we entered World War II. Our latest super-destroyers, displacing 2,200 tons, approach small cruisers in size and armament. And now transports and cargo landing craft, which formerly brought troops and supplies to beachheads already secured, are giving way to "assault ships" that take direct part in amphibious fighting operations. Comparatively shallow draft enables them to launch

SUPERDESTROYER. Resembling a small cruiser, the 2,200-ton *Allen M. Sumner* typifies the growing size of U. S. ships of all types. Its tonnage is exactly twice that of the four-stackers that fought the Germans in the First World War

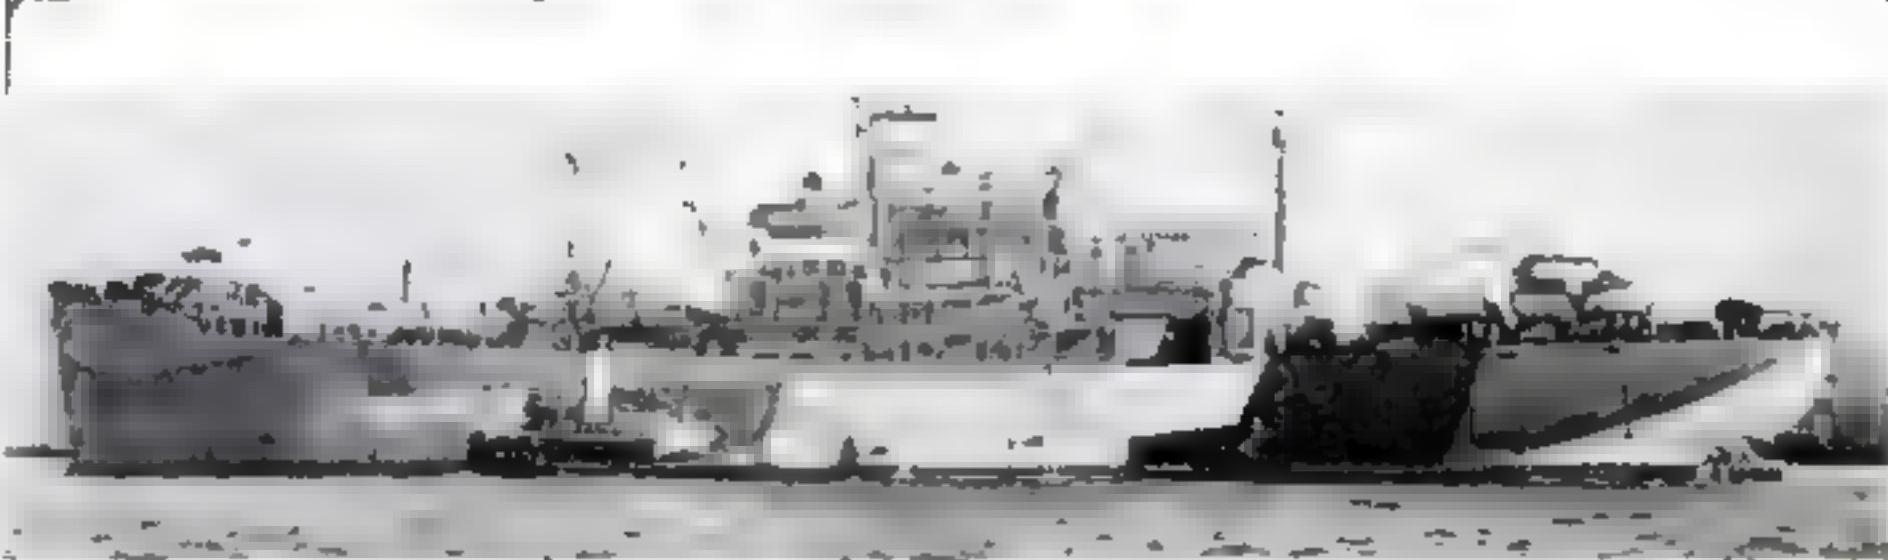

45,000-TON BATTLESHIP. War paint decorates the *Missouri*, new member of our Iowa class. "Big Mo" and her sister ships are believed to be the only man-of-war in the world that outclass Japan's Yamato ship for ship. The gun nest on the *Missouri*'s bow distinguishes her from the *Iowa* (page 91)

GHOST SHIP. Heavily damaged at Pearl Harbor, the re-fitted *California* returned to the battle line and settled an old score with blazing guns off the Philippines. Doubtless, the Japs wish their bombers had done a better job. Four other battleships damaged in the sneak attack—*Pennsylvania*, *Maryland*, *Tennessee*, and *West Virginia*—also have avenged themselves

ARE CARRYING THE BALL FOR THE U.S. IN THE PACIFIC

ASSAULT SHIPS. Heavily armed transports, developed for use in Pacific invasions, take a direct part in amphibious operations and cover troops as they dig in. Above is the 492-foot U.S.S. Burleigh, an "APA" in Navy parlance. Successful experiments have also established converted destroyers, called APD's (right), as standard ships for fast transport of smaller contingents

invasion barges and cargo lighters close to shore, and heavy armament covers landing parties while they dig in. Top priority has been given to mass production of these assault ships, designed especially for use against Japan.

Assault transports, or APA's for short, land a complete combat team of hundreds of men. Simultaneously, assault cargo ships, or AKA's, bring up ammunition and miscellaneous supplies. Plans for a given operation call for a definite ratio of AKA's to APA's. Larger than standard Atlantic landing craft, the assault transports provide commodious quarters and anti-tropical ventilation, so that the men will arrive fresh and full of fight after a

voyage lasting for weeks instead of days.

Converting destroyers for use as fast troop transports provides another way of landing invasion forces. First tried out some years ago, the experiment has proved so

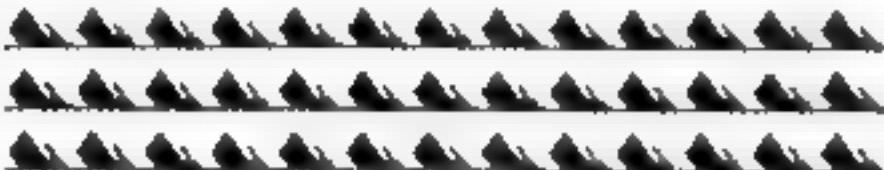

OUR SUBS HAVE TAKEN A HEAVY TOLL OF ENEMY SHIPS

Penetrating the home waters of Japan, during U.S. submarine commanders and crews have hacked at the enemy's irreplaceable naval and cargo tonnage. The

scores given below show ships definitely sunk in the first three years of the war. "Probables" and damaged craft would boost the tally far higher than this

NORTHERN ENGAGEMENT

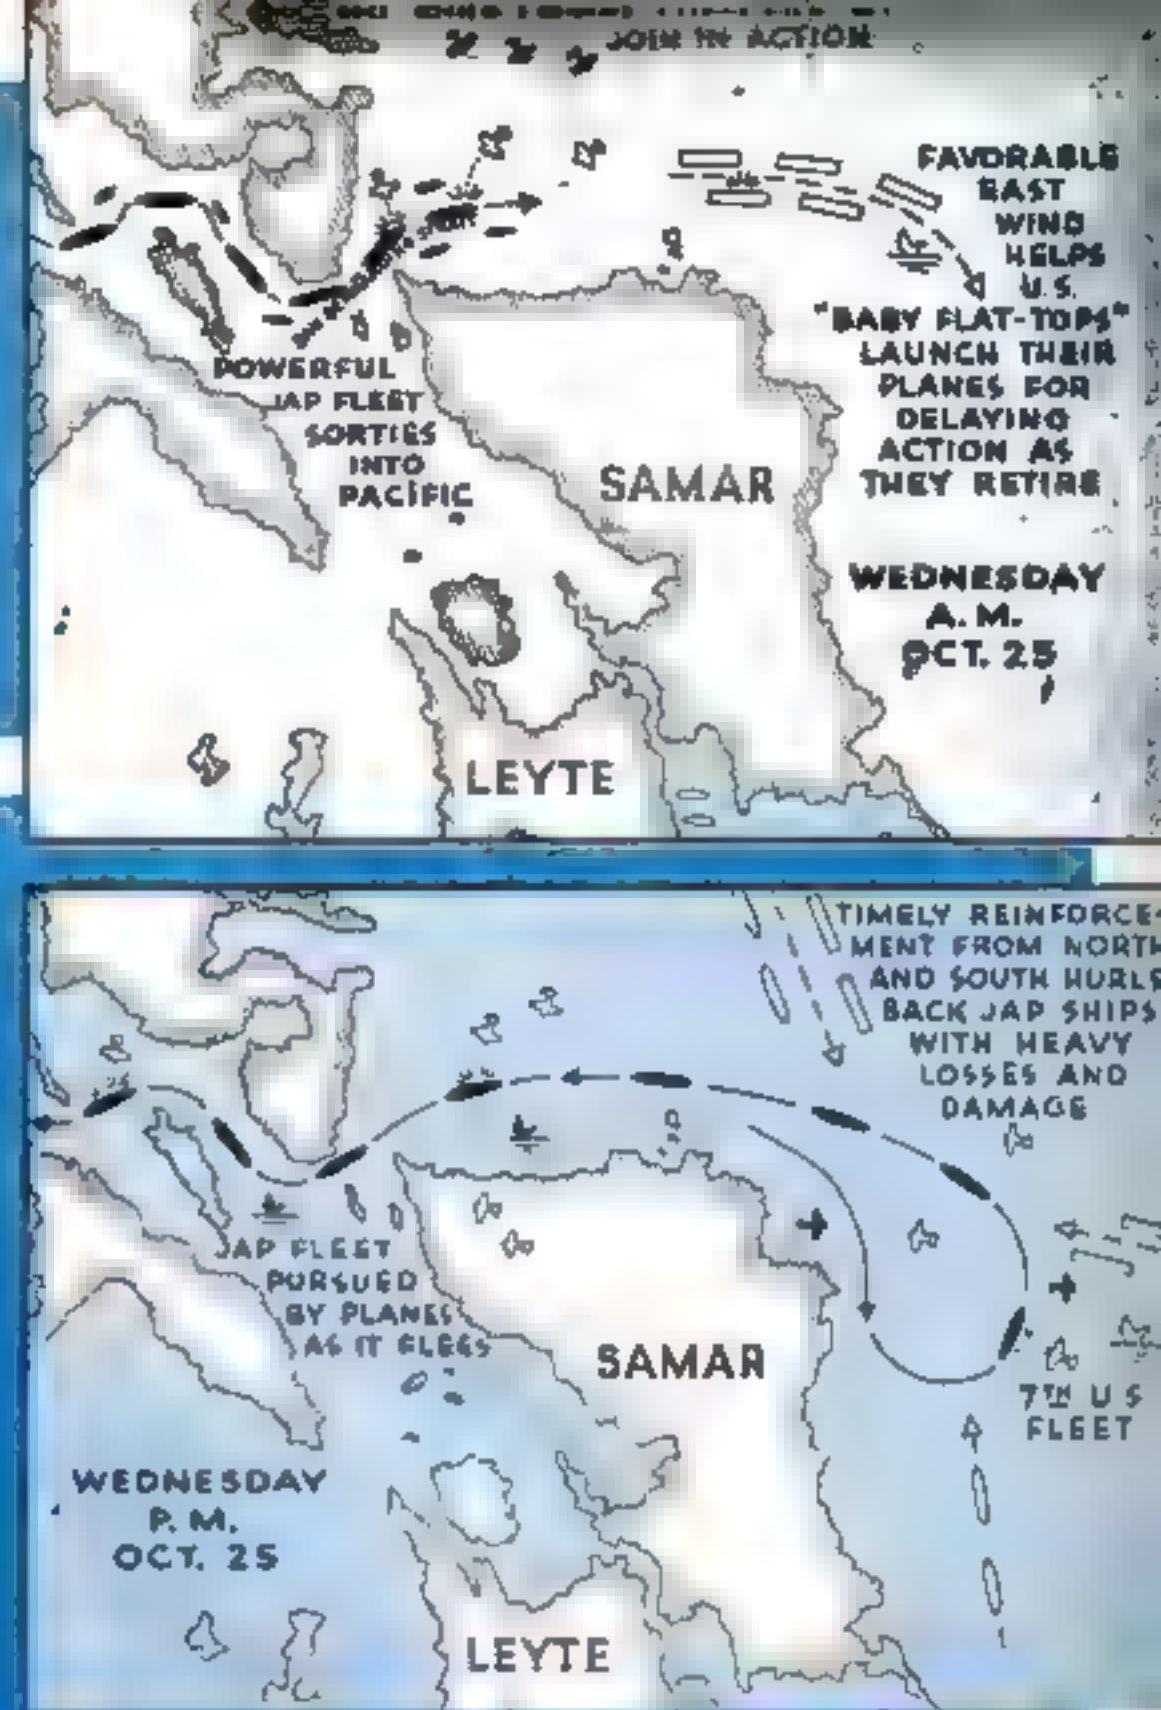

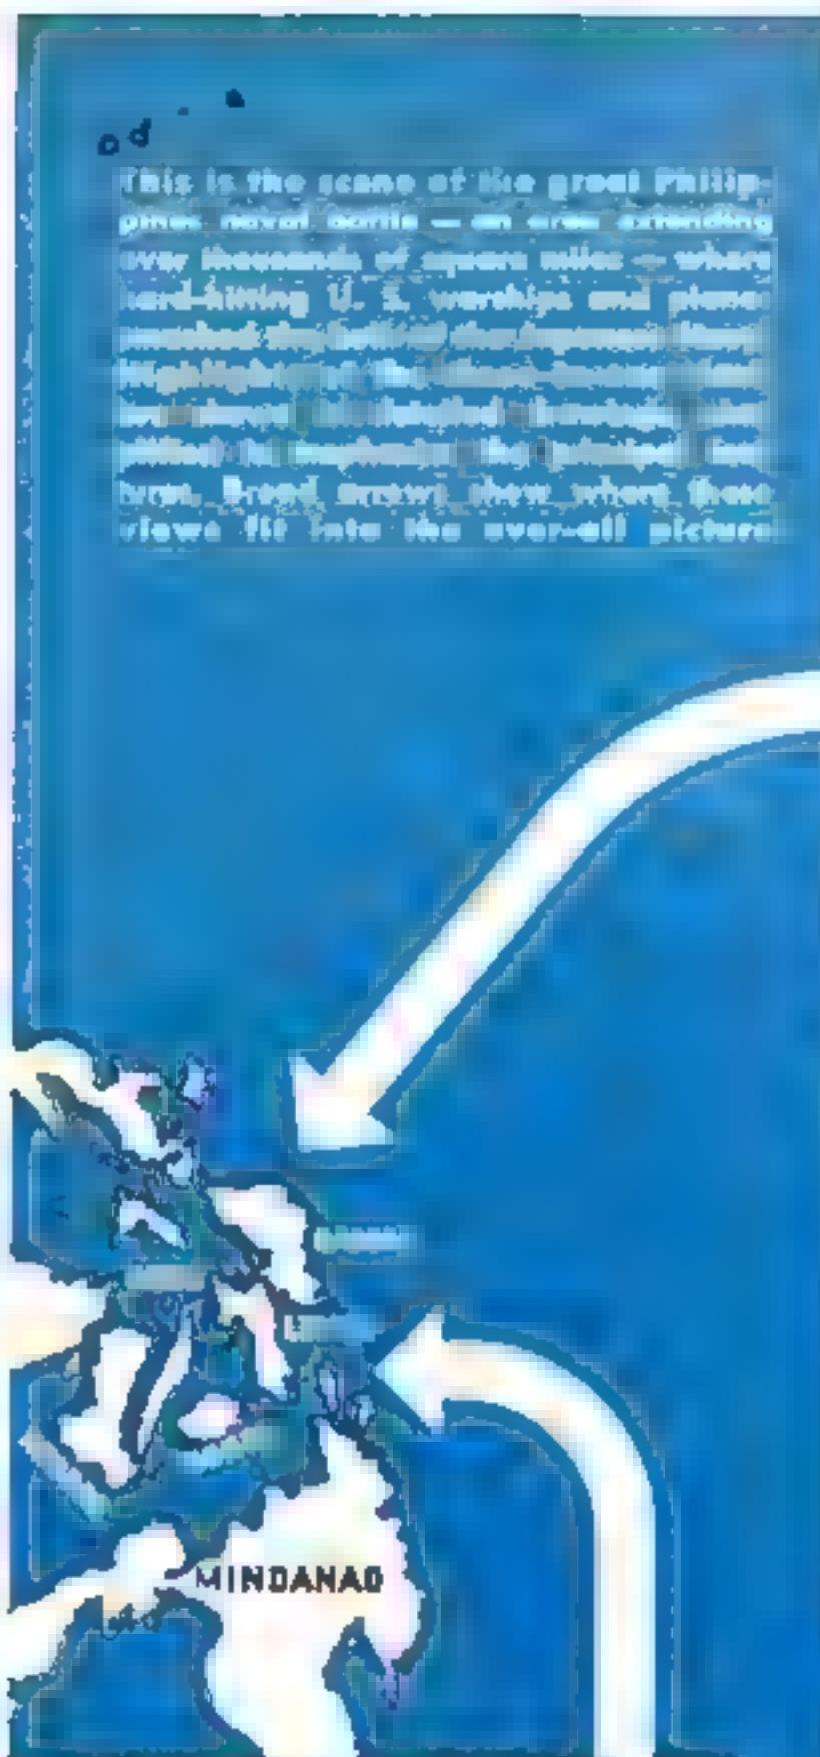

After surprising the Japs with a dawn attack, Adm. Halsey speeds northward in the night to meet the remnants of the Jap fleet that fled after the surprise dawn attack that sinks the heavy battleship *Ise*.

SOUTHERN ENGAGEMENT

Steaming to meet a Jap fleet entering Surigao Strait (first map) Adm. Kinkaid smashed it with a classic naval maneuver (middle map). Pursuit (map at extreme right) revealed that a destroyer or two were all that escaped out of the entire enemy fleet.

Maps by Signal Corps

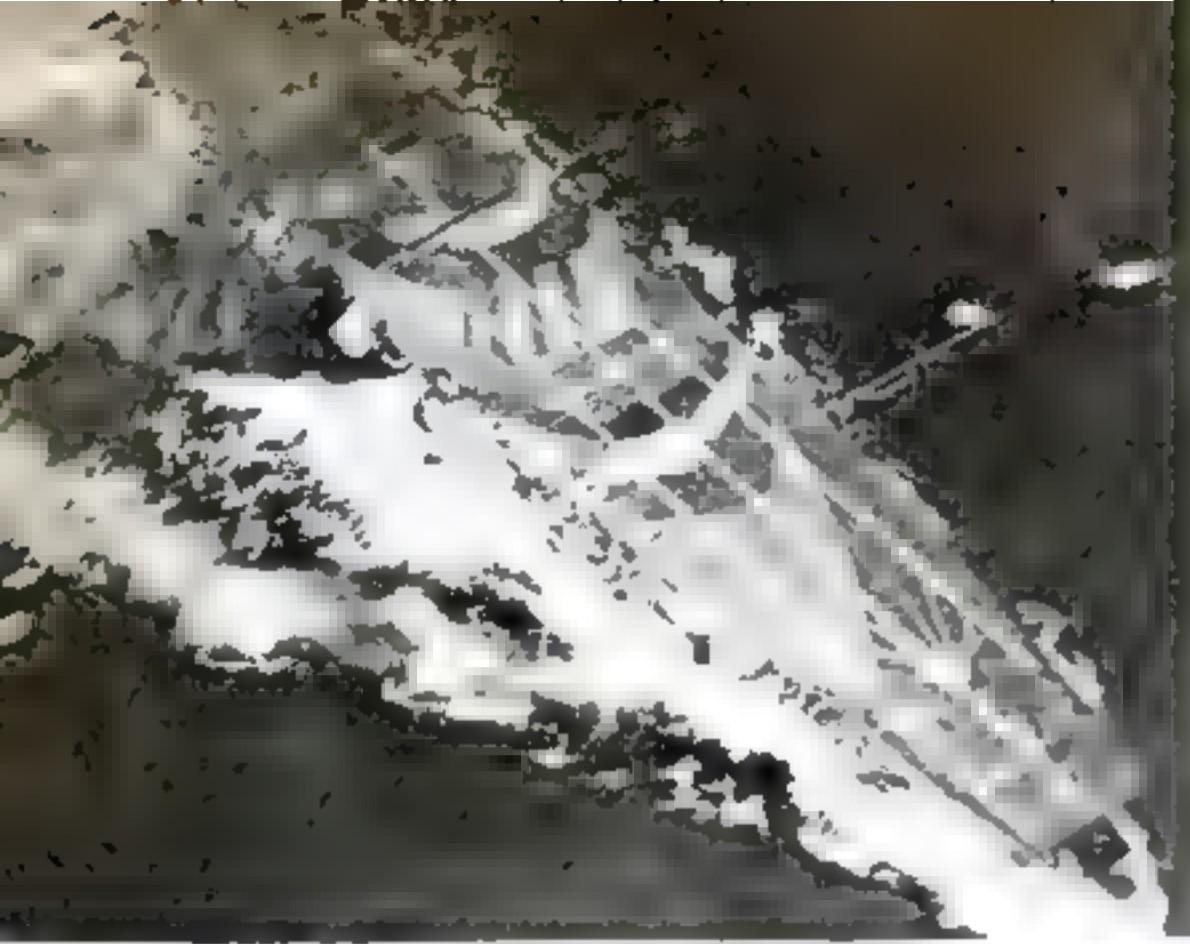

CENTRAL ENGAGEMENT

In the upper map, as the pursuing enemy fleet moves through the Samar-Leyte straits, planes hawk light night attacks to force the Japanese fleet to flee. In the lower map, planes pursue the fleeing Japanese fleet as it flees from the central engagement area between Leyte and Samar. Reinforcement from both the north and south hurls back the Japanese ships with heavy losses and damage.

successful that the APD's, as they are called, have become standard ships of the U. S. Navy.

"Beach rockets" of 4½-inch size, which blast shore defenses with the punch of 105-mm. artillery shells, now are fired in salvos by specialized landing craft carrying hundreds of them, according to a recent statement by Rear Admiral George F. Hussey, Jr., Chief of the Navy Bureau of Ordnance. Owing to the stepped-up tempo of the Pacific war, rocket-firing ships and planes will require a threefold increase over the nearly \$100,000,000-a-month production of the projectiles a few months ago, the Navy estimates. Besides explosive rockets, the Navy employs

CAMOUFLAGED CARRIER. Painted with imitation turrets, guns, and superstructure, this Nip flat-top was meant to be taken for a battleship. Not fooled by the disguise, U. S. bombers pounced upon the two-timing craft and sank it, in spite of the desperate zigzagging that is apparent in the photograph at the left

LAY OF THE LAND on objectives in the Pacific is studied by airmen and invasion troops with the aid of flexible relief maps of rubber composition. Prepared from aerial reconnaissance photos, the durable three-dimensional charts may be tossed on a deck like rugs and scanned by large groups of men at the same time

incendiary rockets for obtaining range, and smoke rockets for screening troops.

This should be bad enough news for Japan's naval commander in chief, Admiral Mineichi Koga—if he has managed to survive the rapid turnover of Nippon's war leaders—but worse is yet to come. A powerful new British fleet under Admiral Sir Bruce A. Fraser, including ultramodern battleships and carriers, will fulfill Prime Minister Churchill's promise of seapower to help America crush Japan. Not to be confused with the British force in the Indian Ocean, the Pacific armada will be based on Australia, and is expected to operate in close teamwork with Fleet Admiral Chester W. Nimitz and with General of the Army Douglas MacArthur.

These, then, are the tools of Japanese and Allied seapower—so far, a one-sided picture. How about the men who use them? Best-informed opinion ranks Jap naval officers and men as the cream of the Empire's armed forces, whose fanatical courage makes overconfidence on our part supreme folly. Even with their depleted battle fleet, they may confidently be expected to pounce upon any advantage that our extended lines and the slightest miscalculation may give them. Thoroughly schooled in the unwritten "rule book" of naval warfare, they perform at their best so long as everything goes according to

plan—as in their sneak attack on Hawaii.

But they have their weaknesses, too. Let plans go awry, and the Jap totally lacks Yankee initiative to grasp and exploit an unexpected situation. And incompetence in his high command, elevated to exalted posts by the feudal system of caste rather than for merit, has had an unfortunate way of placing him in just such embarrassing positions. For six months, the Japs delayed pressing home their temporary advantage at Pearl Harbor—and then dispatched a fleet of warships and troop transports to seize Hawaii. (*Continued on page 228*)

Your Pin Up—

NORTH AMERICAN P-51 MUSTANG

Versatility is the word for the fighter featured in this month's pin-up from an official Army Kodachrome. Designed from combat experience, the Mustang started out as a hedge-hopper and worked its way up to high-altitude fighting. As a photo-reconnaissance plane (F-6), it carries guns and bombs as well as a camera

new ideas from

HARDLY MATCHLESS, but safe and convenient is this new container invented by Nathan Hammer, New York City. It consists of two radially arranged cards of safety matches stapled at the axis between cardboard disks. A sector of the cover, slightly larger than the individual triangular match, opens to allow the removal of a unit. This flap is a safety device, for it must be closed before the match can be lighted, since the striking surface is on the outside. Package and matches are well adapted to advertising use through printed sales messages.

THUMB LEVER OPENS SPOUT

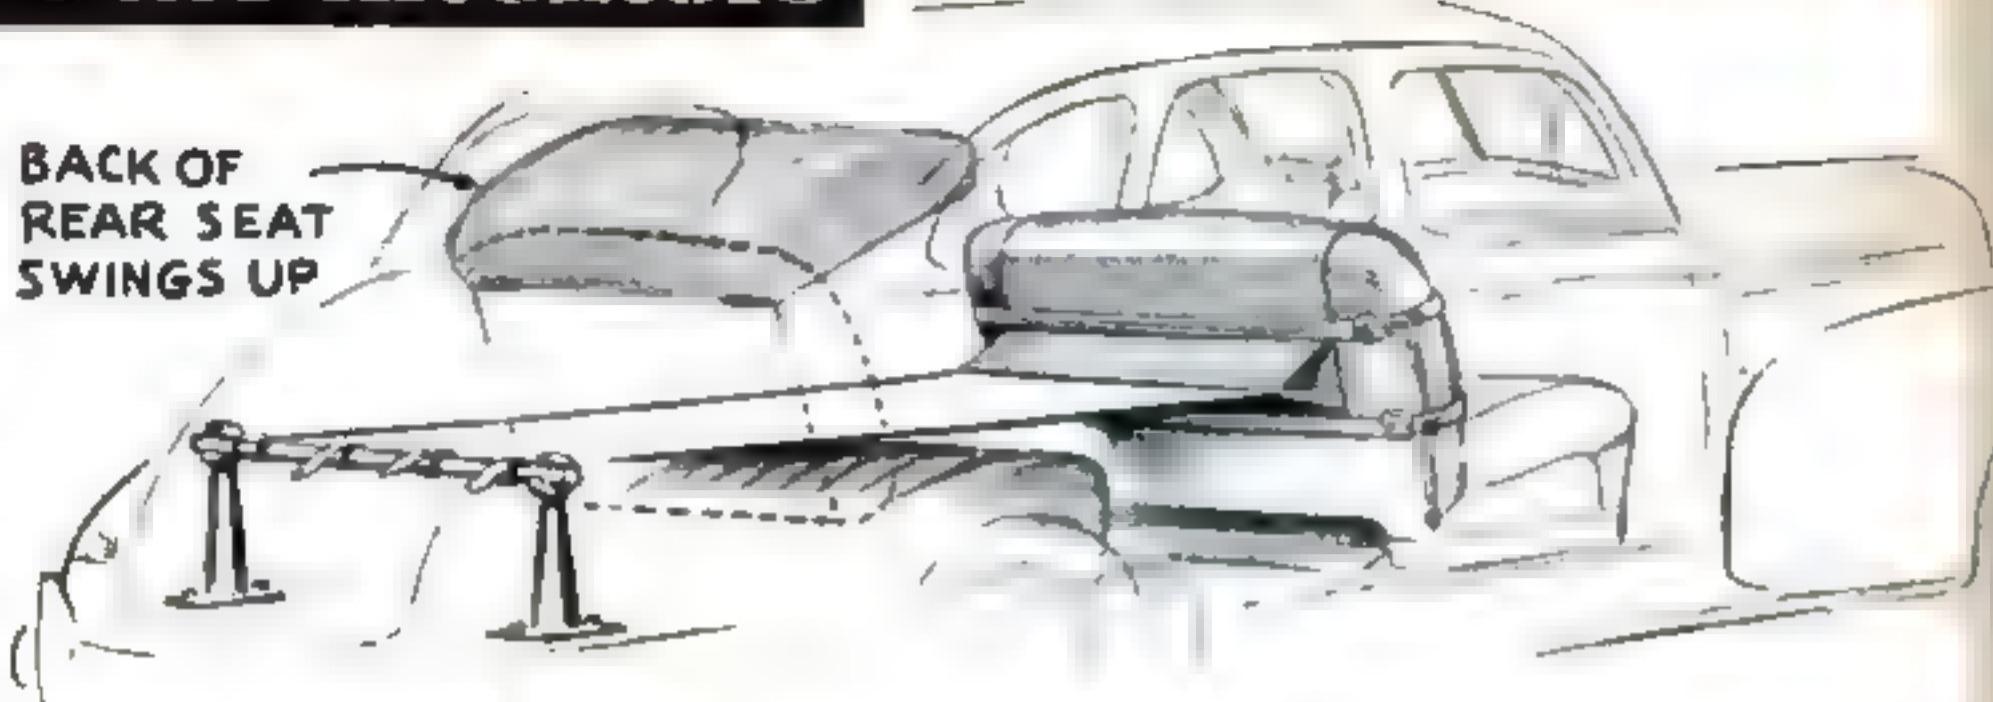

EASY POURING from a milk or cream bottle is accomplished with this spout-and-handle attachment devised by Georgia Darnell, San Diego, Calif. It consists mainly of a pouring cap made of adaptable material and fitted with a sliding closure that can be easily brought to an open position with the thumb of the holding hand. There is a vent in the cap to admit air when the bottle is in pouring position. An appropriate handle extends from the edge of the cap and ends in an adjustable clamp that fits the bottle snugly. The device may be left on in the refrigerator, for it occupies only a minimum of additional space.

TWO STRINGS TO ITS BOW. That's why this ladder won't sag perceptibly in use. Made in the form of a bowstring girder, its sides, in which the rungs are fixed, provide the arc; and the tie rods, or bowstrings, the chord. According to a well-known mechanical principle, when a person climbs the ladder his weight tends to straighten the side pieces and thereby put the tie members in tension. The ladder may be made of any suitable metal, either tubular or angle-section, and the tie members of steel tubing or stranded steel wire. Either an extension or a stepladder is formed by locking two sections together, lengthwise or at an angle, by hooks that engage the rungs. The ladder was originated by Frederick Kidd and Thomas Dargue Kidd, Stockton-on-Tees, England.

REAR SEAT
SWINGS UP

YOUR CAR IS YOUR CASTLE when it is equipped with one of these bedlike hammock arrangements that extend from an adjustable strap anchorage on the driver's seat, backward under the raised rear seat to a crosspiece bolted to the floor. Not only does

the hammock make a comfortable bed for overnight camping trips or when hotel rooms are unavailable, but it is adapted to the transportation of ill or wounded persons. It is the invention of Byron Quinby Jones, of the U. S. Army.

SPILL INSURANCE for coffee is the idea behind the saucer designed by Albert Rasch, Portland, Ore. This new piece of restaurant crockery is provided with two circular recesses, one for the coffee cup and the other for the cream jug.

TERMITES DON'T LIKE dichloro-hexanitrotoluene, a chemical formula worked out by a St. Paul, Minn., man, Frank H. Kaufert, who has assigned his rights to Du Pont. The new substance, which is a complex relative of the explosive TNT, is dissolved in a petroleum vehicle, and the method of protecting wood from termite attack is to impregnate the ground surrounding it with the solution. Other insects and organisms yield to the chemical's action.

How I Take Stereo Pix in COLOR

An Interview with Corydon M. Grafton, by Robert E. Martin

TO ONE amateur photographer, a New England snowstorm is more than welcome. It means just one thing to him—a chance to capture another delicate snow crystal and record its fleeting beauty on color film for stereoscopic viewing. Using techniques that are all his own and photo-

graphic apparatus he has built with his own hands, Corydon M. Grafton obtains remarkable results.

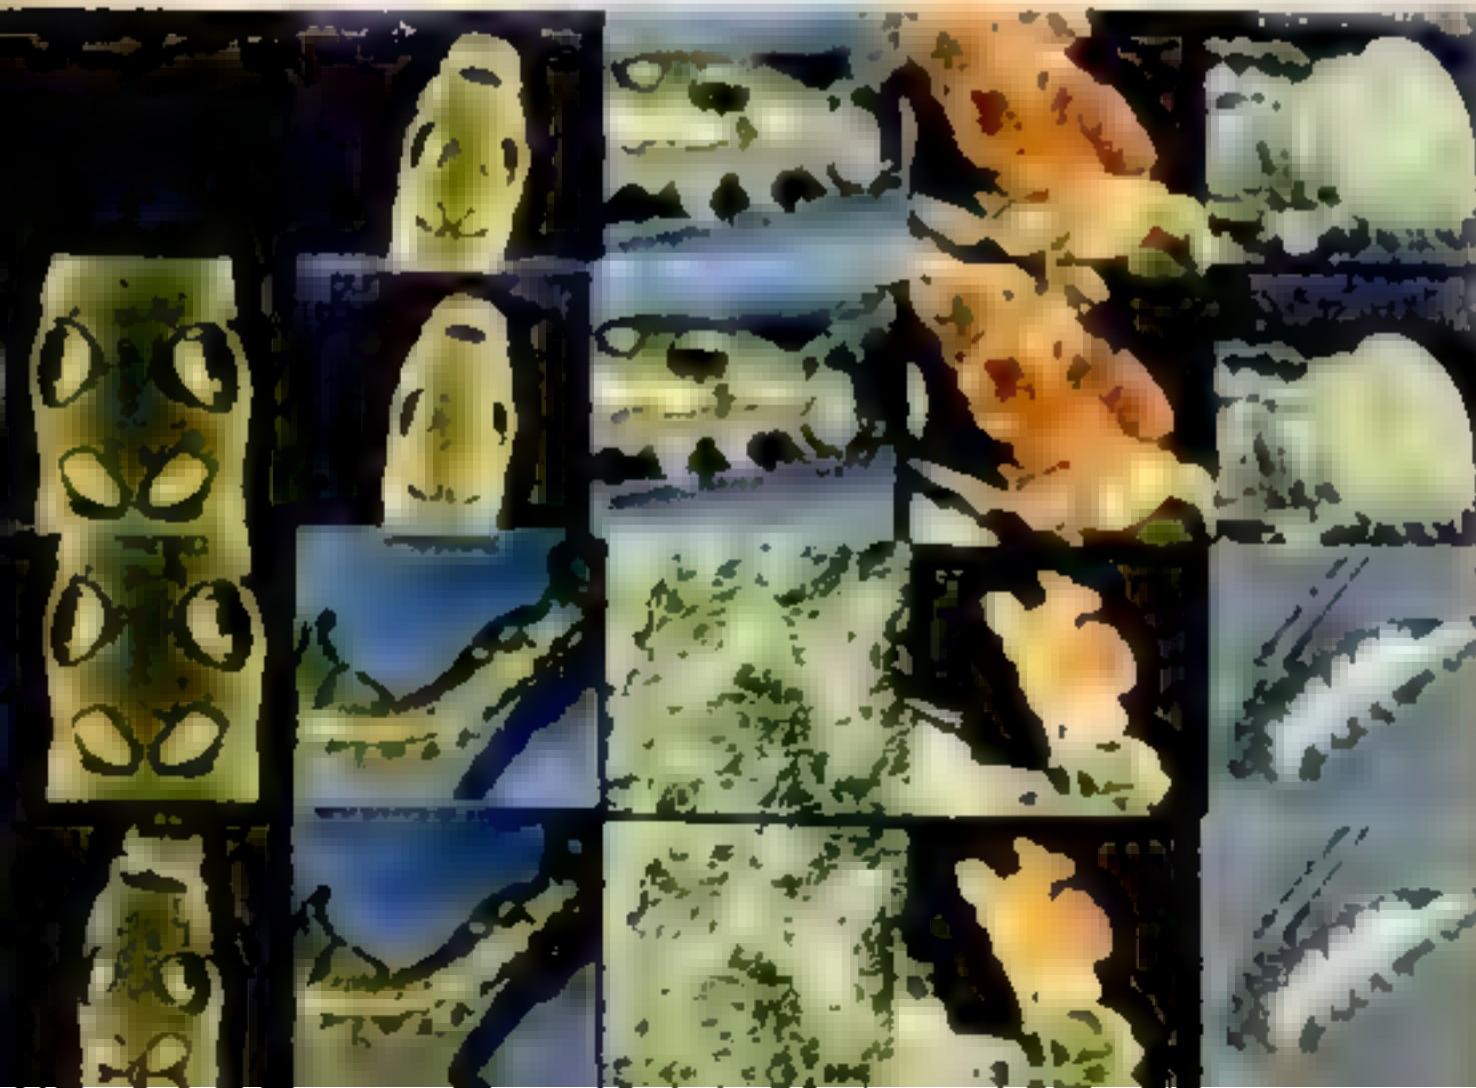

With slight alterations of method, Grafton achieves equally fine results in photographing insects, flowers, and even tiny seeds. Using his homemade bellows, which has a

Tinted cellophane in front of the light source accounts for the colors in this white snow crystal

Crystals "shot" from two angles show modeling when transparencies are viewed in a stereoscope

Grafton makes 20 exposures on one four-by-five film for two reasons; for economy, but equally to obtain increased depth of focus. He achieves this double end by moving his plate holder about on a specially made camera back with guide lines for spacing the exposures

AMATEUR PHOTOGRAPHER GETS RESULTS WITH ORIGINAL METHODS AND HOMEMADE EQUIPMENT

Much-magnified portrait of a katydid taken by Grafton with his homemade camera

1 Snowflakes are caught on a black cloth. Grafton uses a small pointbrush with clipped bristles to pick off the desired crystal. Studio must be cold

three-foot draw, he magnifies his subjects up to 30 diameters. The pictures reproduced on these pages are samples of his work. Viewed in a stereoscope, they are even more remarkable.

In his two-color shots of snow crystals, Grafton is really "gilding the lily," for these crystals actually are colorless. He gives them tints by using cellophane filters of two colors over his light source. The stage on which he places the crystal is on a horizontal swivel, so that he can tilt it for obtaining two shots at different angles for his pairs of stereo pictures. To retain a snow crystal in its original form requires careful control of temperature. A little too much warmth, and it melts; a little too cold and it becomes covered with frost. Slightly above the dew point is the right tempera-

2 Crystal on chilled slide is placed above half-inch hole in a brass block kept cold by solidified carbon dioxide. Thus light can penetrate from below

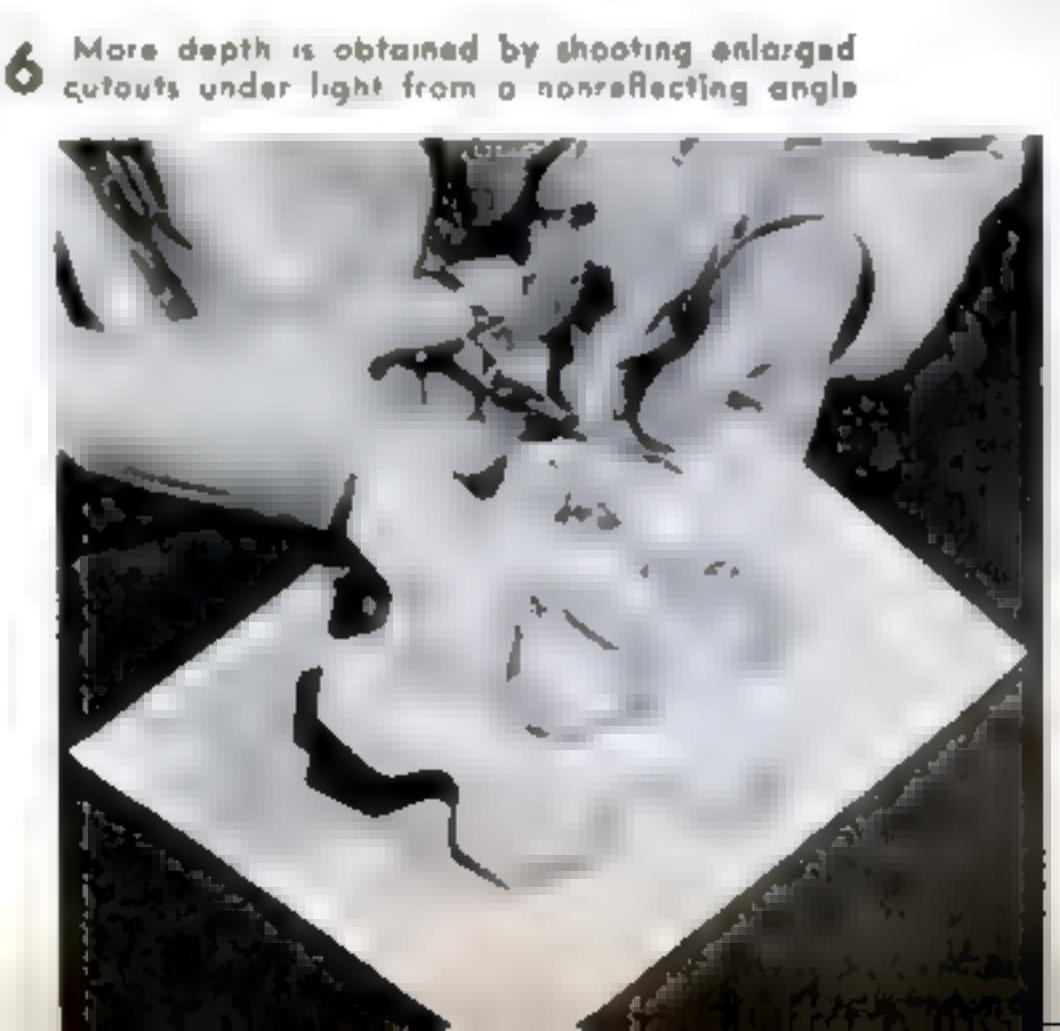

ture. Grafton has found. He works in a cold studio and has a special stage for the snow-crystal subject—a brass plate about a half inch thick which is kept cold by means of a piece of dry ice. The microscope slide on which he places the crystal also is chilled.

The light rays that pass through a snow crystal in the process of photographing it would quickly melt it if the heat were not extracted from them. This Grafton does by placing a heat-absorbing filter of his own devising in front of the reflector. His filter is a $\frac{1}{4}$ -inch thickness of copper sulphate solution held between two glass disks which are clamped tightly against a rubber gasket.

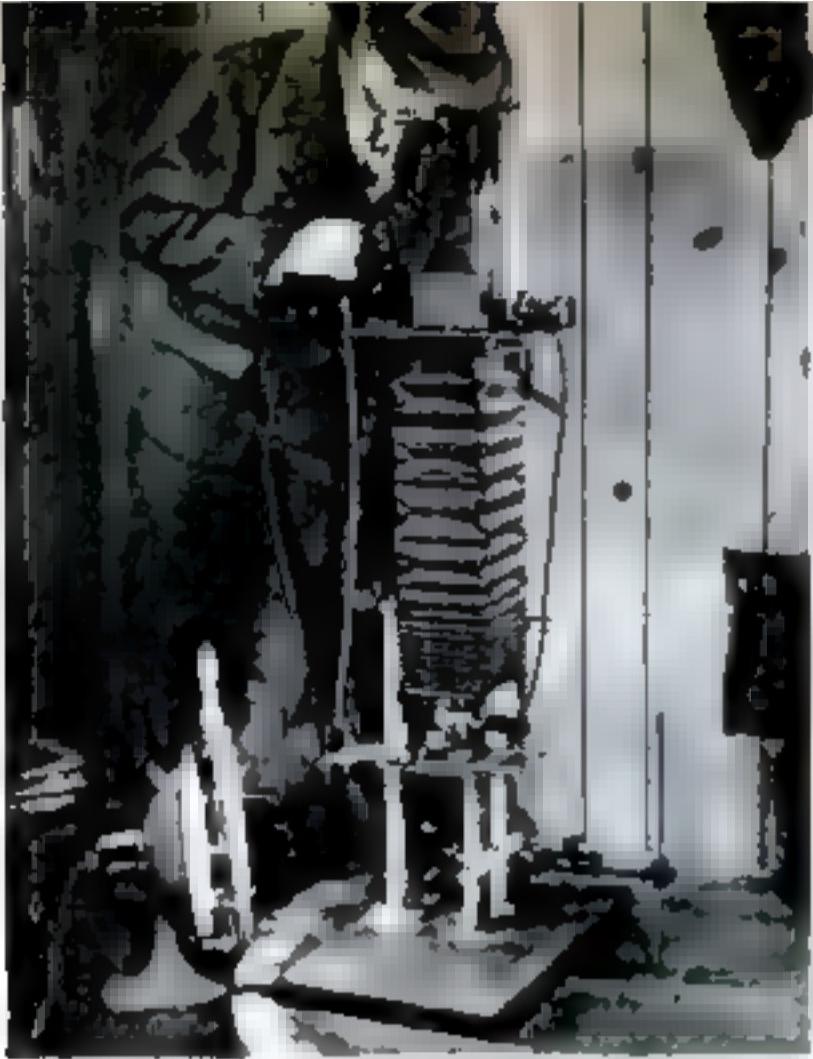

Grafton's apparatus is ingenious but fairly simple in construction. An upright

5 Film holder is clamped firmly onto camera back covered with velvet and marked off in squares

6 More depth is obtained by shooting enlarged cutouts under light from a non-reflecting angle

3 The bundled-up photographer moves the subject with a long rod while he views the image on the ground glass

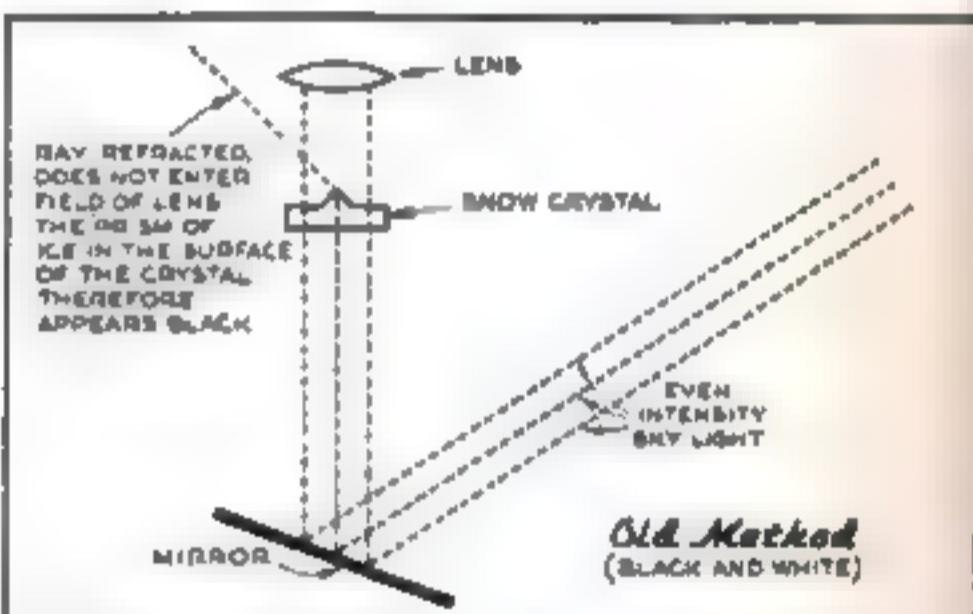

4 Grafton uses his own light meter, which is of the extinction type, having one fixed and one movable polaroid disk. Left hand presses the light switch; right focuses with knob

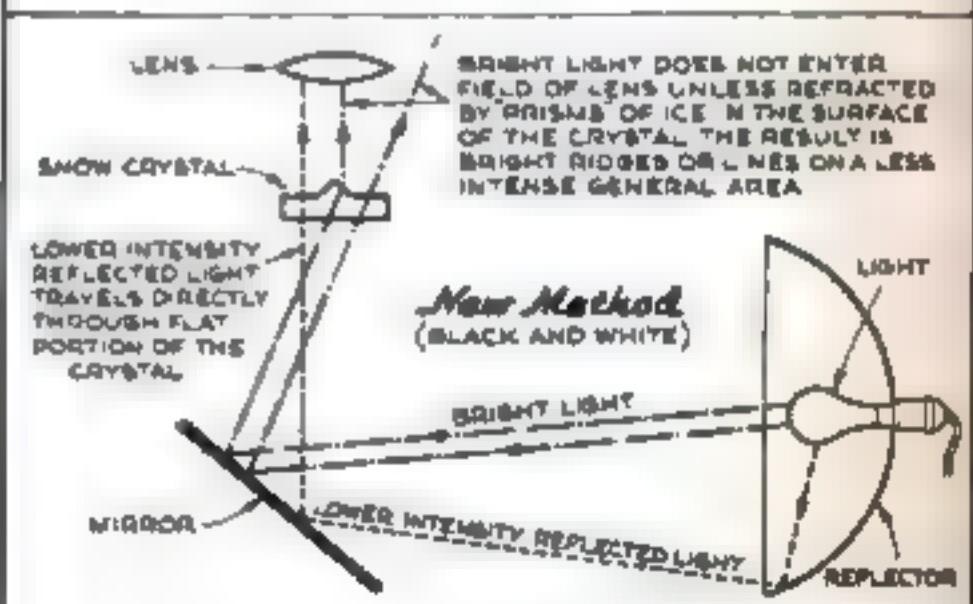

pipe four feet long serves as the backbone to hold the bellows. A threaded rod, with a knob at the top for turning it, makes up his focusing arrangement. Another rod for moving the stage about under the lens also is worked from the top end while the image is being viewed. The camera back is plywood covered with velvet and has an opening one inch square. Grafton has marked off the back into one-inch squares. This enables him to take 20 exposures on a single four-by-five film by moving the holder from square to square.

In photographing flowers, seeds, and insects, Grafton obtains unusual lighting effects by placing small pieces of mirror about them to reflect the light. In such cases, tilting the stage would give a double shadow effect. Instead, he moves the lens in a

7 Clipped photo is glued onto glass and put on frame above a black cloth for rephotographing

Upper drawing shows usual method of photographing snow crystals in black and white, and the lower illustrates Grafton's method. The even-intensity light as diagrammed above produces the black-line pattern picture, while the refraction of reflected rays from nearer the central light into the field of the lens (below) is responsible for intermediate shades. Bright lines on light-gray background are the result

The method of lighting employed by Grafton in taking black-and-white snow-crystal pictures results in the added depth and shadow effect seen here

horizontal plane. This requires a corresponding movement of the opening in the camera back. So the photographer devised simply operated sliding arrangements for both.

Photography has been Grafton's lifelong hobby. He worked his way through college by taking snapshots for sale and by developing and printing pictures. A chemical engineer, he is research director for the Cordo Chemical Co., Norwalk, Conn. Here,

Hydroquinone crystals illuminated with light polarized through a stretched-out polyvinyl alcohol film

No two snow crystals are exactly alike, although every one adheres to a hexagonal pattern. Grafton says the best specimens come near end of snowfall

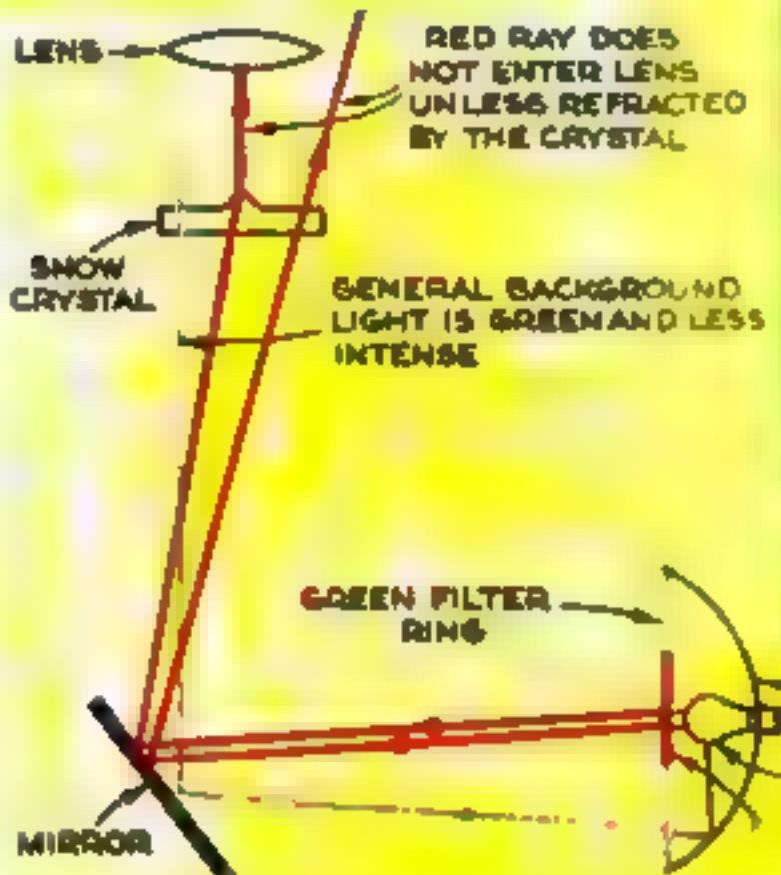

also, his natural inventiveness has made valuable contributions in the field of synthetic adhesives. His technical knowledge was not necessary to his hobby, he says.

In making his snow-crystal pictures, Grafton uses a 32-millimeter micro Tessar and a two-inch Goertz Hypar lens. For other purposes he uses a 16-millimeter microscope objective, a 3½-inch Bausch & Lomb Tessar, and also a seven-inch Zeiss Tessar from his Graflex

Milkweed pod, reduced with enlarging camera by the use of a seven-inch Graflex camera lens

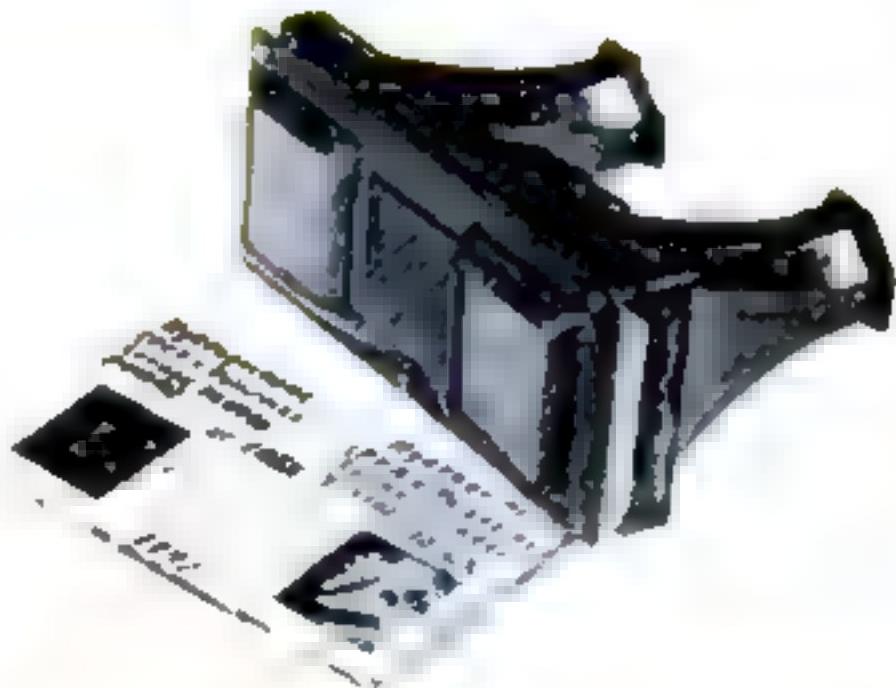

HOW IT'S DONE IN COLORS.
Here is another gemlike snow crystal in two colors, with a diagram of the manner in which it was lighted for photographing. Note important differences from diagram at bottom of page 103, which illustrates the Grafton black-and-white method for taking pictures

*Two-Color
Lighting*

STEREOGRAPHS ARE VIEWED through this adaptation of a century-old device. To obtain the two different exposures for such viewing, Grafton turns the stage on which his subject is mounted from one to three degrees on its horizontal axis. Thus the three-dimensional effect is given the picture as seen with the stereoscope. Windows in cardboard slides are then cut with a homemade die. Transparencies are cemented between pieces of microscope-slide glass and then into proper relationship in the two windows. Care must be taken to avoid distortion through too wide an adjustment of the camera angle and improper mounting

MIRRORED spider setup is prepared with a mounting instrument composed of a pin stuck into a common pencil rubber and a self-devised colorless plastic cement for fixing the insect's feet to the mirror. Specimen is then placed on revolving stand fixed to a hinged piece, giving unlimited range for angles in photographing

Our Army's Defense Against Poison Gas

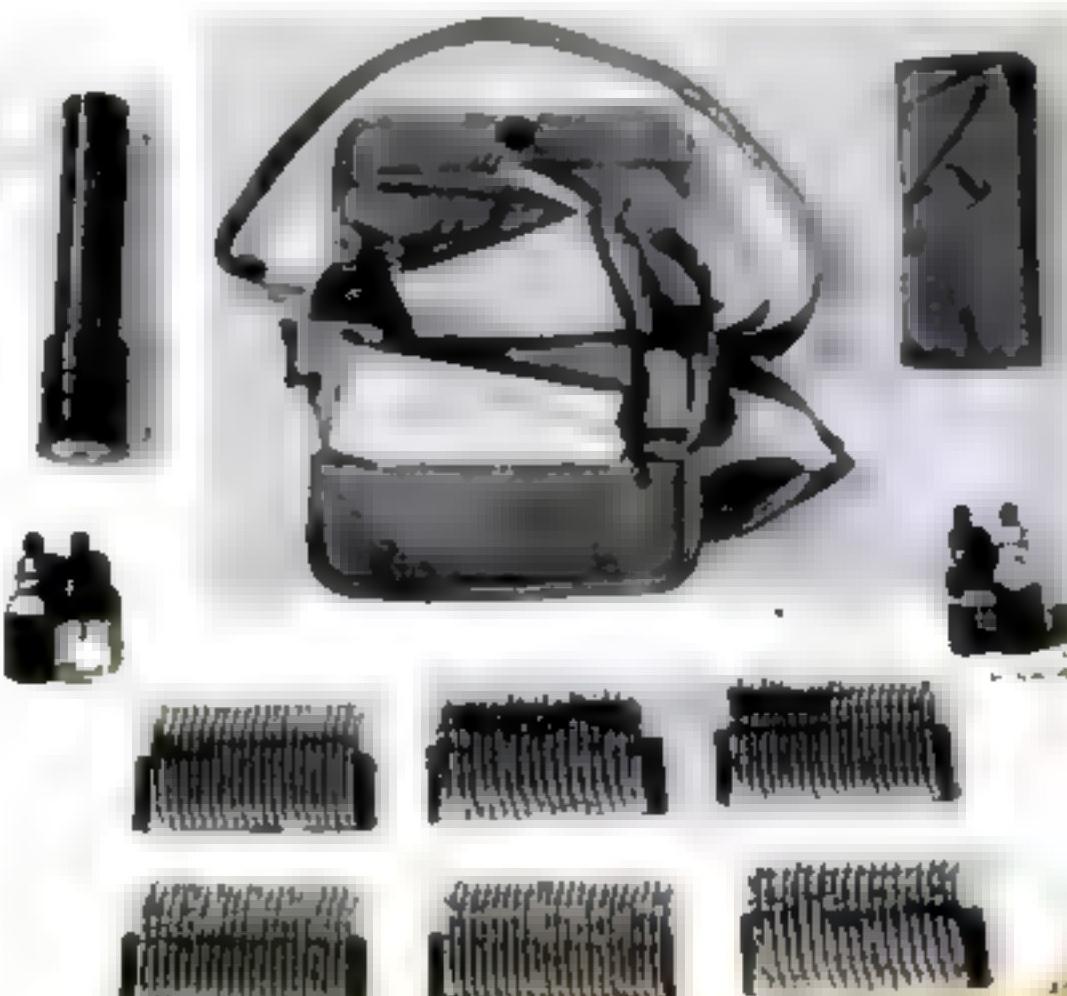

Instant detection, prompt identification, complete protection—that's the Chemical Warfare Service's formula for guarding our GI's against the constant danger of sudden, unexpected, enemy gas attack.

GAS-DETECTION KIT BRINGS

IN SOLVING the two big problems of defense in gas warfare—detecting the gas and then protecting personnel against it—our Chemical Warfare Service has developed equipment that safeguards our soldiers from every war gas now known. One of these detectors is a veritable chemical laboratory which has been condensed into a handy 2½-pound field kit, and which can also be used to identify the gas. Others are chemically treated paper, chalk, and paint that give prompt warning of invading blister gas by a quick change of color. Protective equipment, equally ingenious, includes gas-repellent clothes, impermeable envelopes, neutralizing ointments, and the best gas mask in the world.

The kit, which is placed in the charge of the gas noncom of each company, contains (left to right, top to bottom) suction pump; case containing pencil, note pad, color-guide card, and waterproof envelopes for samples; waterproof covering for the case; four reagent chemicals; six racks of small glass tubes

FROM HEAD TO TOE this York soldier is dressed for the dangerous job of decontaminating an area that has been drenched with gas. His equipment includes a gas mask, an impermeable coverall, shoes specially treated inside and out to prevent gas penetration, and heavy gloves, under which he wears a cotton pair treated with a strong repellent. Because this coverall is practically airtight and doesn't allow his body to breathe, he can work in it only for short periods, then comes out for air

By GOLD V. SANDERS

Photographs by WILLIAM W. MORRIS

NO SUDDEN attack with war gas on any front can catch American soldiers defenseless and unprepared as in World War I. No matter what new surprise gas a desperate enemy might spring on us, we can break it down quickly, right in the front lines, and counter it before it can produce disastrous results.

Never forget that the Chemical Warfare Service is right there at the front, too, wherever American soldiers are fighting. Its highly trained experts are a part of every division, of every company. They are eternally sampling the air our soldiers breathe for the slightest trace of poison

gas or irritating chemical. And they are superbly equipped, thanks to that same American inventive genius which has given us the world's best offensive weapons and other tools of war.

A marvel of ingenuity and simplicity is the miniature gas-detection kit pictured on these pages. One of these goes along with every company into battle, handled by a man trained in the Chemical Warfare School. Weighing only 2½ pounds, it is so cleverly worked out that it can detect and identify any of the known war gases in a few seconds, right on the spot. If a gas should be found which is not identifiable, a sample of it can be taken up from the air with one of the prepared glass tubes and then sent promptly to the laboratory

CHEMICAL LABORATORY TO FIELD OF BATTLE

One of the glass tubes is inserted in the end of the suction pump. Containing silica gel, it will absorb gas from the air that is sucked through it. A drop of the right reagent will produce a telltale color

Besides the four bottles of reagents shown in the photograph at left there are three tubes of reagents, which fit compactly in the hollow handle of the pump

Here the pump is ready for action. By comparing color of "gated" silica with color guide, gas is easily identified. In some cases a gas will produce characteristic color without aid of reagent

Chemical warfare has thought of everything, including a flashlight (with waterproof switch) in the handle so that the tests can be made at night

SAMPLING THE AIR for gas, the suction pump is held close to the ground where the gas concentration is strongest. If the enemy springs a new gas, special glass tubes can be used to capture a specimen, which is then sent to a field laboratory for analysis.

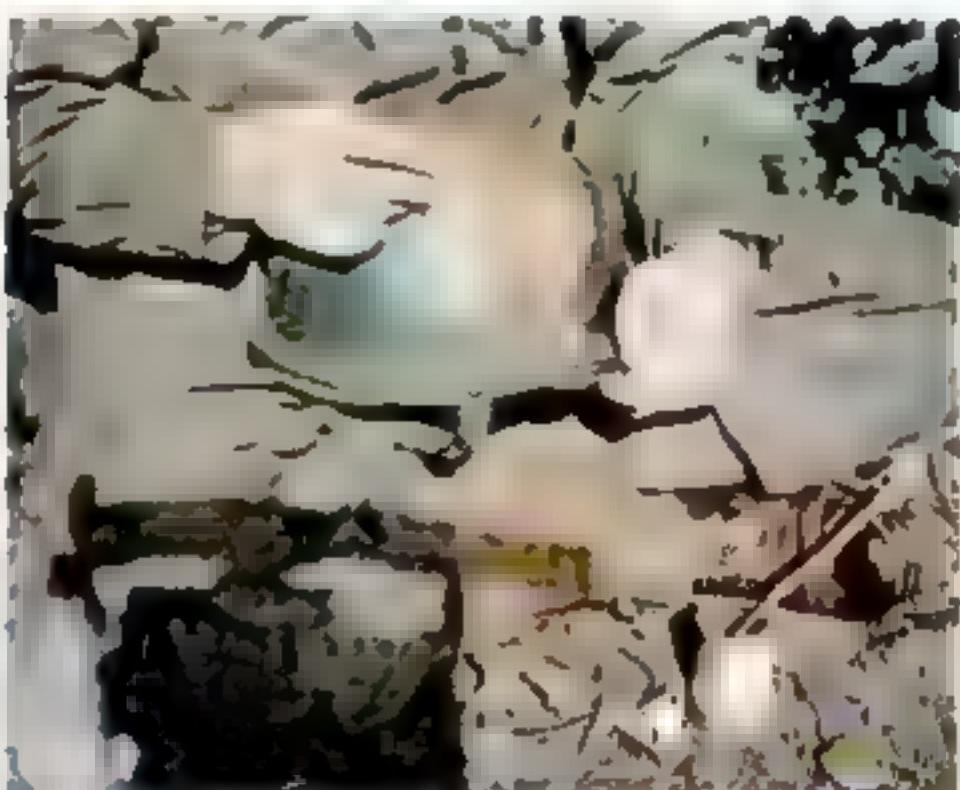

for immediate analysis by its chemists.

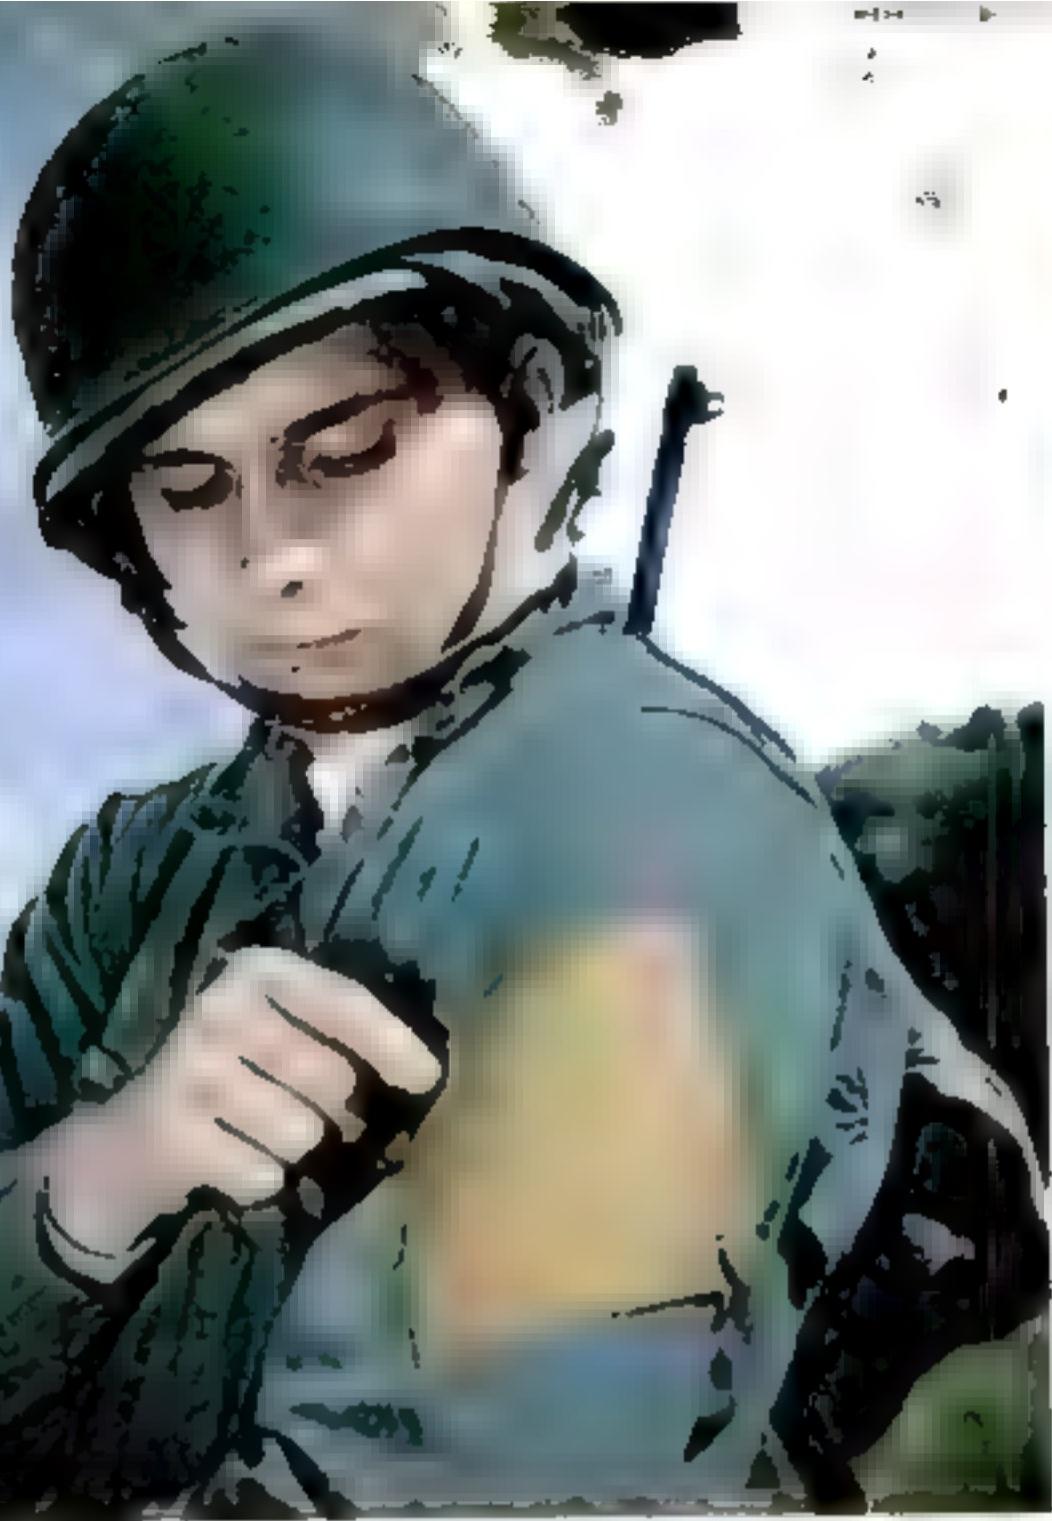

Detecting the presence of gas is, of course, the first essential in defense against it. Foolproof and positive as the detection kit is, it is not necessarily the first device to discover an attack. A soldier's helmet may suddenly blossom out with fiery red spots, a warning that the enemy has let loose blister gas. The helmet is coated with gas-sensitive green paint, developed by the Chemical Warfare Service. Every drop of vesicant gas that touches it will produce a flaming danger signal in five seconds. Every soldier knows what it means. The warning gong is sounded and the whole unit can be protected from the miseries produced by these irritating chemicals. The same paint may be used on vehicles or equipment.

A similar protective device consists of gas-sensitive cardboard, colored green and cut into small squares. This can be used in countless ways; laid on the ground, fastened to vehicles, pinned to uniforms, tacked on fences. Droplets of blister gas make red spots here, too. Still another innovation is chemically treated crayon to be used in marking vehicles and equipment. It is bright pink and turns blue on contact with the poison stuff.

One man in each company or equivalent unit carries a special gong to be used only to sound a gas alarm. When this sounds, every front-line soldier knows exactly what to do for self-protection, and is equipped to do it. He dons his gas mask, which is the finest ever devised. His special-issue

PAINT that a GI can daub on his helmet (above) or any other handy surface enables him to do his own gas-detecting. Olive drab is color, the point will turn to a flaming red (left) five seconds after it comes in contact with even the lightest concentration of any one of the three known blister gases. The instant the GI gets a "red light," he knows it is time to don his mask and gas-repellent clothes.

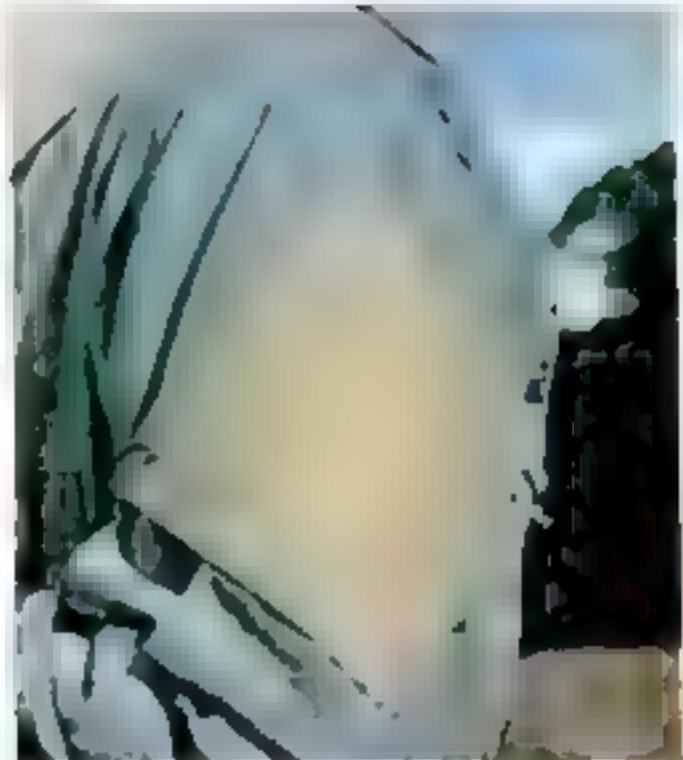

uniform is impregnated with a chemical that neutralizes blister gases in any ordinary degree of concentration. Underwear, socks, shoes, gloves, and a special hood all are similarly treated. With all of this carefully buttoned up, the soldier is practically immune to blistering chemicals, but he also has in his gas-mask case two plastic envelopes large enough to cover him completely if there should be a heavy fall of liquid poison from airplanes. Furthermore, he can push his gun muzzle through one corner and keep on shooting.

If blister gas has reached the soldier's skin in spite of all these protective measures, he has in his kit tubes of ointment that will neutralize it if used in time.

These are the protective means used in the field by individual soldiers in the midst of combat. It is only one

CHALK MARKS also play their part in warning troops that gas is in the area. Specially treated, the pink chalk, when drawn on a surface on which there is only a slight amount of blister gas, will quickly turn to a bright blue. If it is rubbed across a dry surface and then wetted with even an extremely small concentration of a vesicant, the same change of color will take place

PAPER SHEETS, greenish in color and chemically treated, are another means of warning soldiers of the presence of gas. One drop of a vesicant, and a brilliant red spot appears. The sheet can be worn on the arm, tacked to a fence, stuck on the end of a bayonet, or put any other place where it will be easily seen. Near one corner of the sheet is a small hole. Should a drop of liquid gas larger than this hole appear on the sheet, it will mean that the concentration of gas is too strong for his clothes and the GI had better get under his plastic envelope.

PROTECTION for American soldiers against skin-scorching vesicants and deadly gases that attack the lungs is provided by gas-repellent clothing and the finest gas mask in the world. If a GI is operating in an area where he might be subject to a gas attack, he dons underwear, socks, coverall, and shoes, all of which have been specially treated to resist blister gases in ordinary amounts. In the event of an attack, all he then needs to do is to put on his mask; don a protective hood (above) that fits over his head, around the edges of the mask, and down over his shoulders (below); and pull on a pair of heavy gloves. From the skin out, the GI's clothing is designed to give complete freedom of movement, and to keep out gases while admitting sufficient air for the body to breathe.

part of the elaborate system of preparation worked out by the Chemical Warfare Service with full co-operation from our gigantic chemical industry

There are also gasproof field shelters in which staff officers can work with complete protection from gas attack. Immense "breathing machines" inhale the poisoned air from outside and exhale purified air into the shelter, which may be either a standing building or a portable structure.

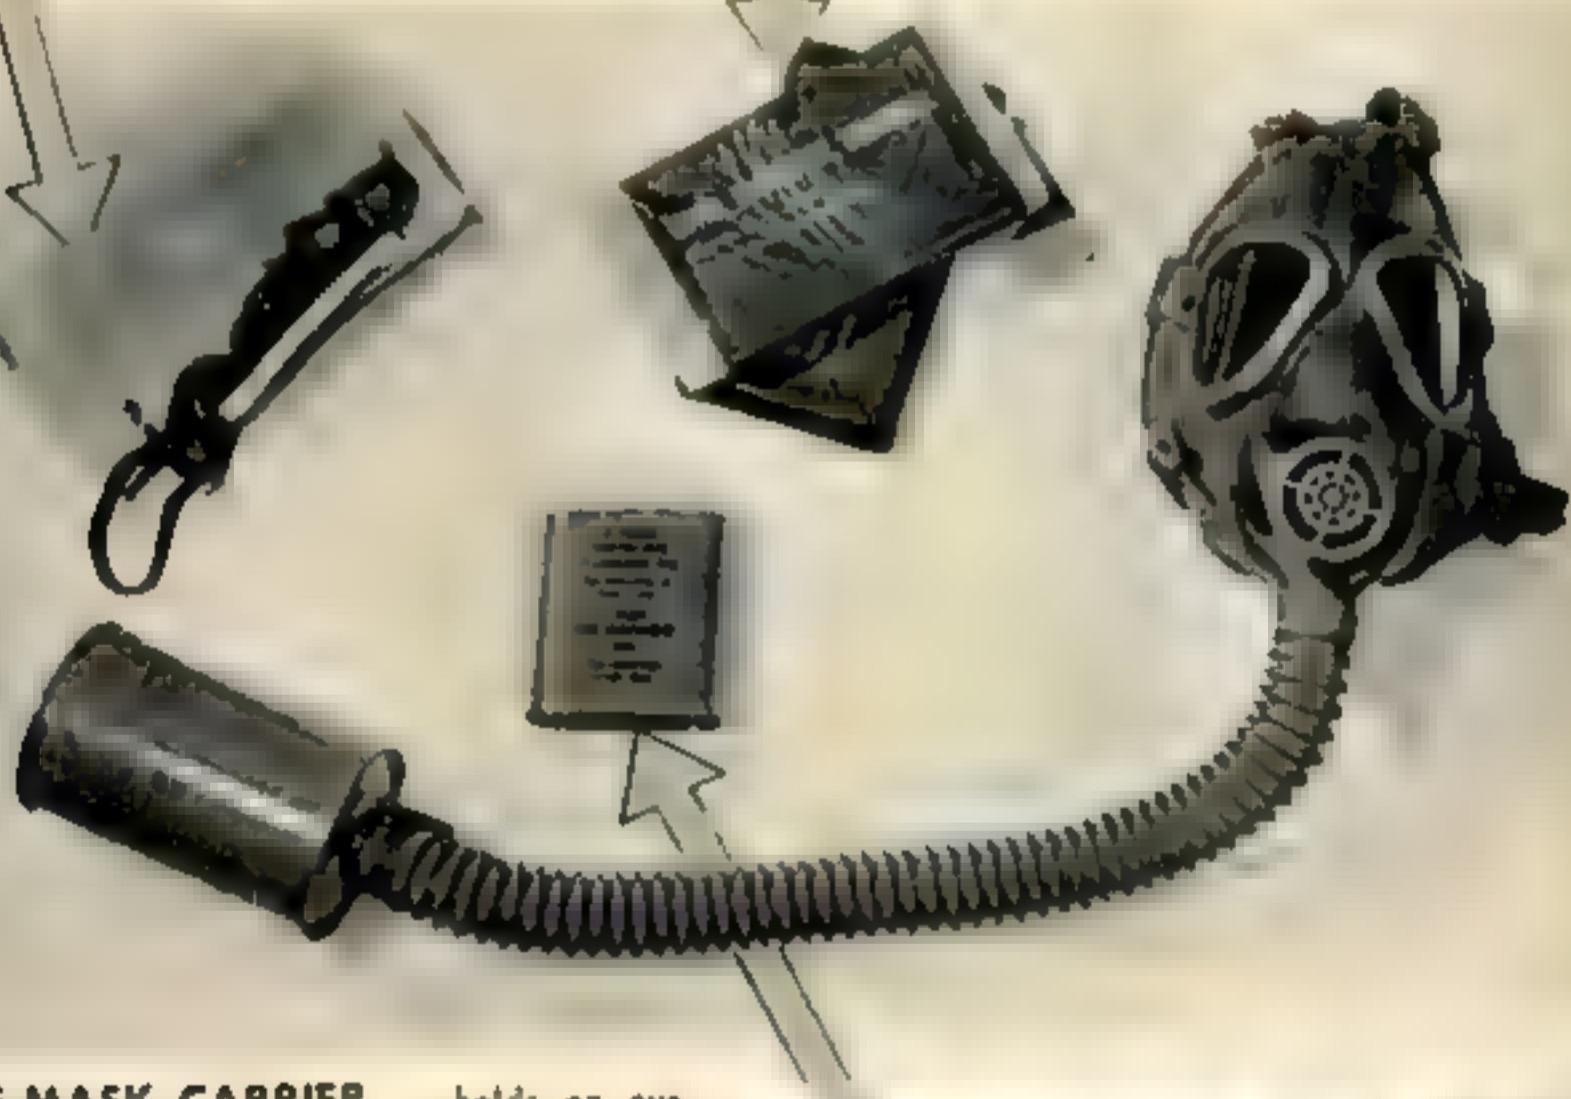

The Chemical Warfare Service also has the responsibility of preparing for retaliation, and it has been stated frequently, for the benefit of the enemy, that we are fully equipped in this respect.

EYE SHIELD, snug-fitting and made of plastic, is always worn in areas where there is a danger of gas which may be as yet undetected. It also serves to protect the wearer's eyes in the event of surprise attack

PROTECTIVE COVER, under which a soldier can crouch, offers protection from gas in any liquid concentration. While the cover limits his mobility, the GI can shove his rifle through an opening in one corner and keep on peppering away at the enemy

GAS-MASK CARRIER holds an eye shield, two protective covers, a can with three tubes of ointment for blister gases, and the mask itself, with hose and air-purifying canister attached. All fit compactly in the carrier shown in position at left

OINTMENT neutralizes vesicants and prevents painful blistering of the skin. GI's are taught not to be misled by gases that do not burn at first. Ointment must be used immediately after contact, else it may be too late

"Green Gold" OF WYOMING

How prospectors are
finding a fortune in
boulders of high-grade
American green jade.

A small, light-green rock sticking above ground, when finally unearthed, turned out to be this 3,366-pound boulder of solid jade. Prospectors, still not fully convinced of the value of the rocks they've been kicking around for years, pile 'em up carelessly in back yards (below).

When Bert Rhoads found this 125-pound piece of "green gold," he turned prospector and jade carver

FORTUNES lying around loose on the ground in Wyoming have been passed up by generations of residents with no more than a casual glance. Now those green rocks, scattered at random among the sagebrush, have turned out to be nothing less than jade. The rush for the "green gold" is on—and some of it is actually worth more than gold, ounce for ounce. Substantial citizens are giving up regular occupations to hunt the green stones over the wastelands of the Sweetwater country. Some have already become fairly wealthy.

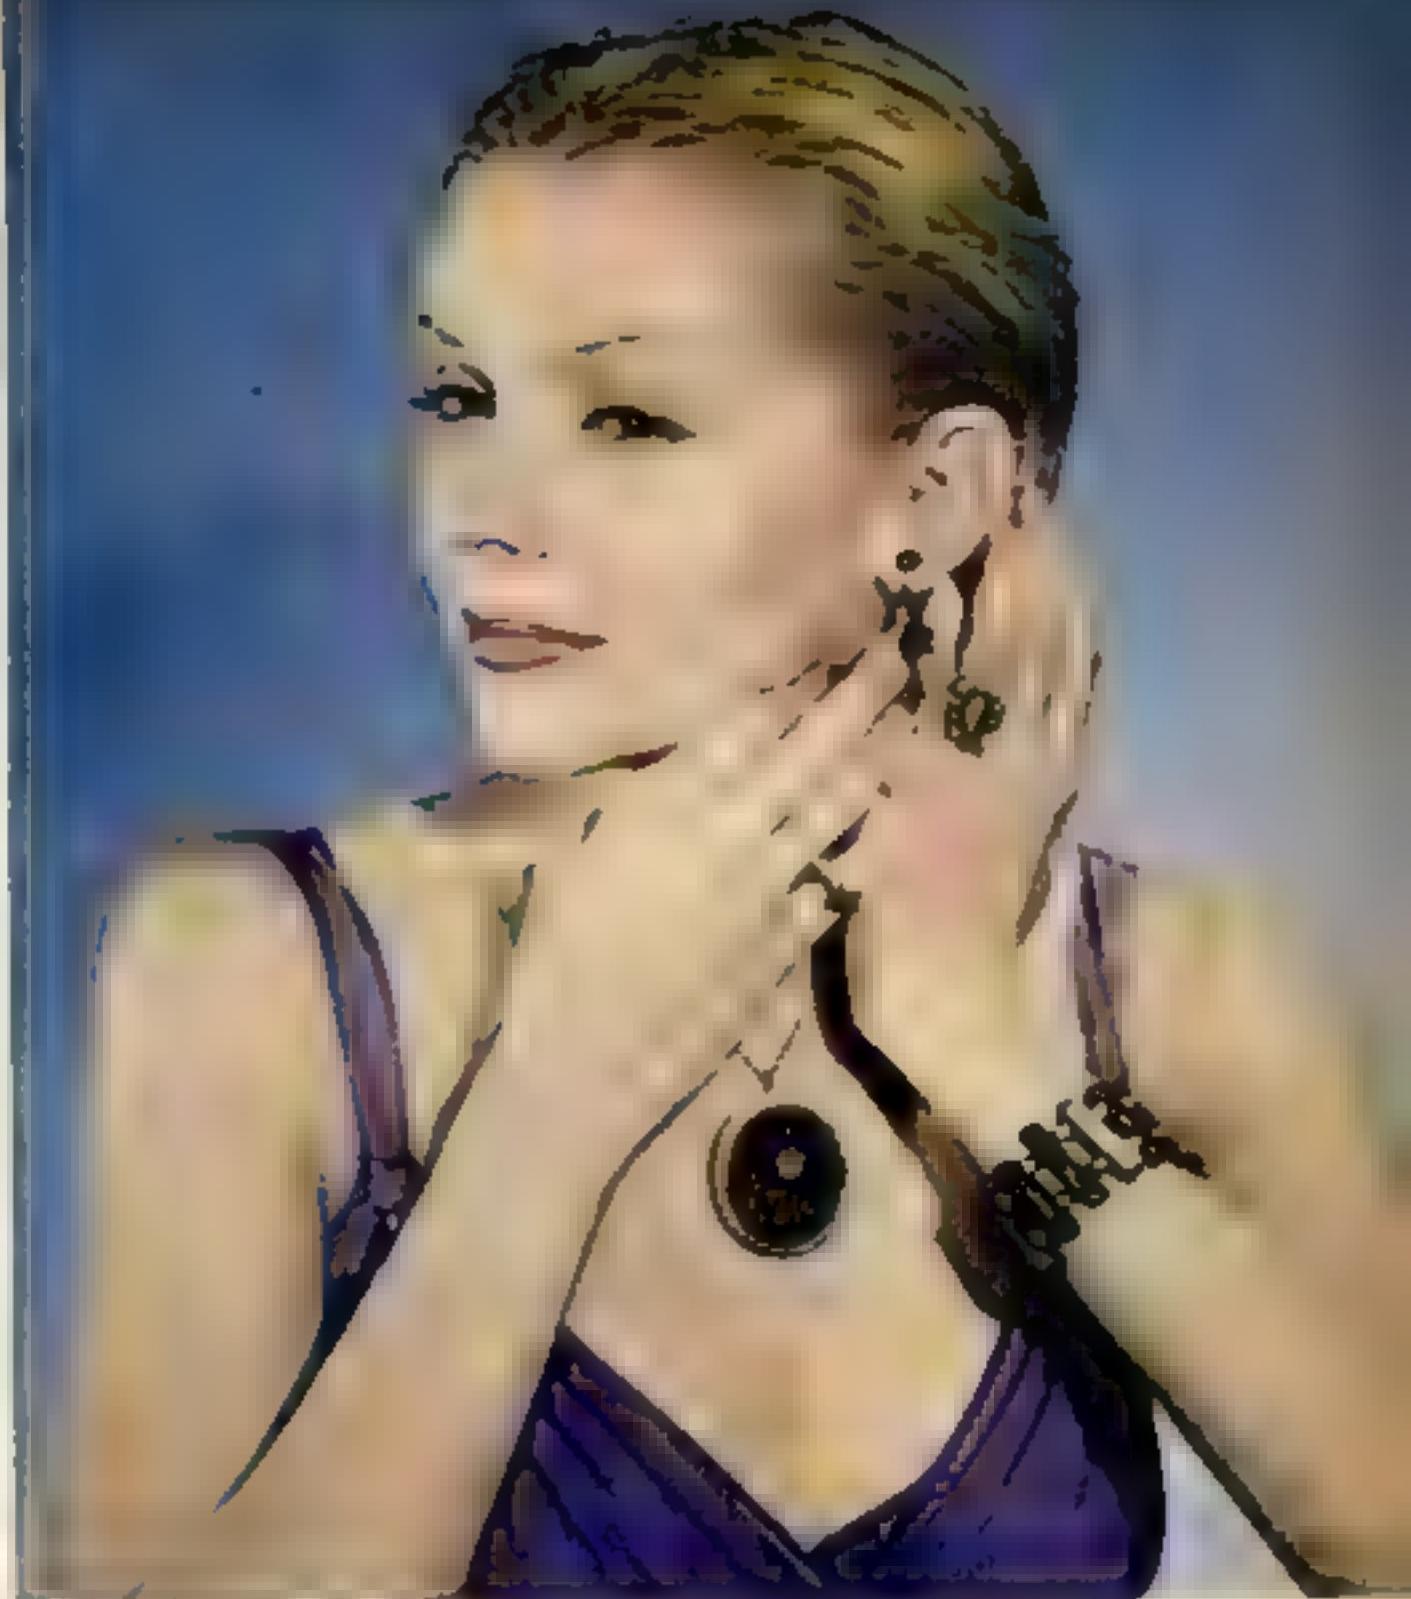

This is the first substantial find of jade in the Western Hemisphere and it is an immense one. The jade area is at least 600 square miles in extent, and possibly much greater. Only the surface has been touched. Jade prospecting up to now has been

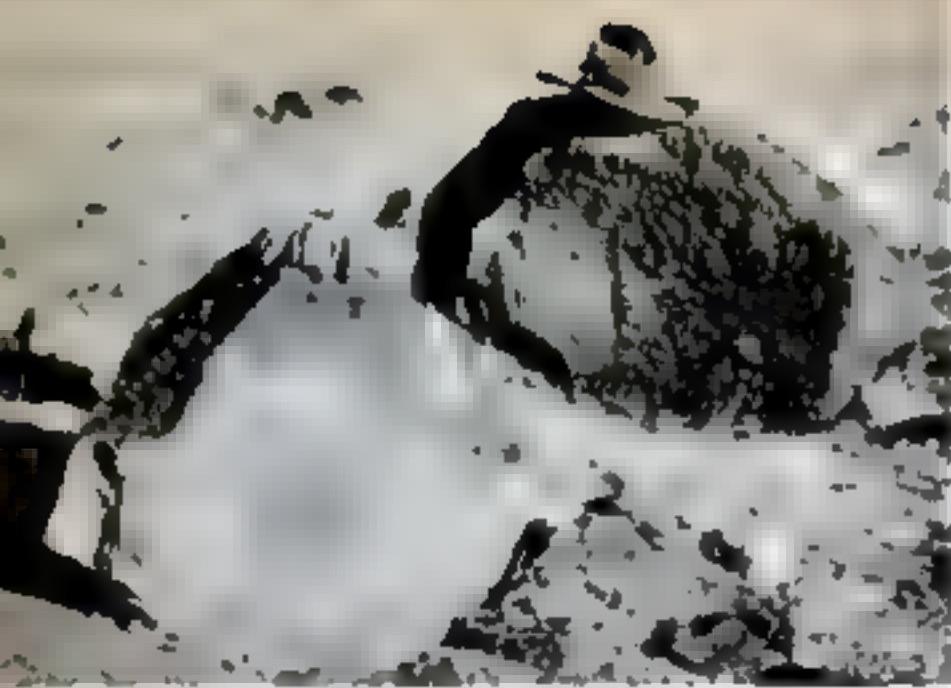

Salt and pepper shakers and wine glass made by Bert Rhoads, and a partly worked piece, show wide color variation of Wyoming jade

Here are some fine examples of Wyoming jade jewelry. Pendant was cut and polished by James L. Kraft, cheese manufacturer, who has made a hobby of collecting and cutting jade. The bracelet, ear-drops, and ring are the work of Bert Rhoads. Establishment of jade cutting as an American art will provide a new outlet for native creative talent and may give China some stiff competition in the postwar jewelry market.

In color, jade ranges from black to white although it is best known for its rich, beautiful shades of green. These pendants, with the exception of the heart, cross, and teardrop, were cut and polished by Kraft, whose interest in the mineral took him to the town of Lander where he helped to convince the local townspeople that a fortune lay at their feet.

Wyoming has a lot of rocks, but not all of them, like these two, are worth over 15 dollars a pound

Larger of these jade pieces, weighing 2,400 pounds, was presented by Mr. Kraft to a Chicago museum

merely a matter of roaming the countryside and picking up those green pebbles, chunks, and boulders that are in plain sight. Some have been so polished by the elements that they look as if they had been painted and laid out to dry. Others look much like ordinary stones until a piece is chipped off with the little prospecting pick the jade hunter uses. Of these there is doubtless an immense amount to be discovered, not to mention what is under the surface. No vein or mother lode has been found.

Two women, hunting the precious stones near the town of Lander, spied a nice, light-green one partly hidden by a clump of sagebrush. It was about the size of a man's hat—they thought. They tried to loosen it from the earth but it wouldn't budge. They dug with their picks, and the more they dug the larger it grew. They hurried back to bring their husbands and a big wrecker. After hours of digging and hauling, the two men got it out—3,366 pounds of high-quality jade, a fortune for two families.

There have been other finds almost as sensational. Allan Branham, manager of a grocery store in Lander, discovered a

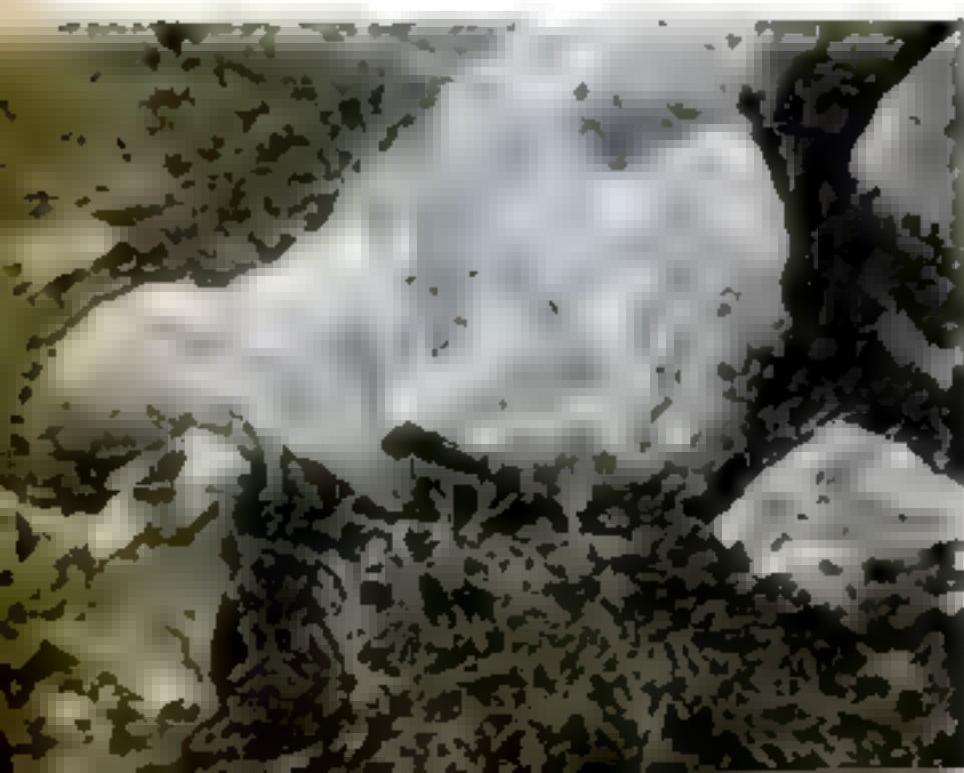

hunk of jade weighing 2,410 pounds. It was bought at once by James L. Kraft, cheese manufacturer, who donated it to the Field Museum (now Chicago Natural History Museum). Mr. Kraft is a jade hobbyist and has been collecting and cutting the mineral for years. He heard of the Wyoming discoveries and went out to investigate. His visit was a big factor in awakening the local citizens to the immense value of their newly revealed mineral wealth. He told them the jade found there was as high in quality as any that comes from China.

Allan Branham gave up his position and now devotes his time to prospecting for jade. Among many others, he found another huge boulder which he has sold to a Chinese buyer. Other Chinese jade experts have come and bought tons of Wyoming jade, though it cannot be shipped to the Orient until after the war.

Bert Rhoads, proprietor of a furniture and hardware store in Lander for the past 20 years, got hold of some cutting and polishing equipment and started making pendants, crosses, and cabochons of the jade, just as a hobby. He found he could sell all he made at *(Continued on page 208)*

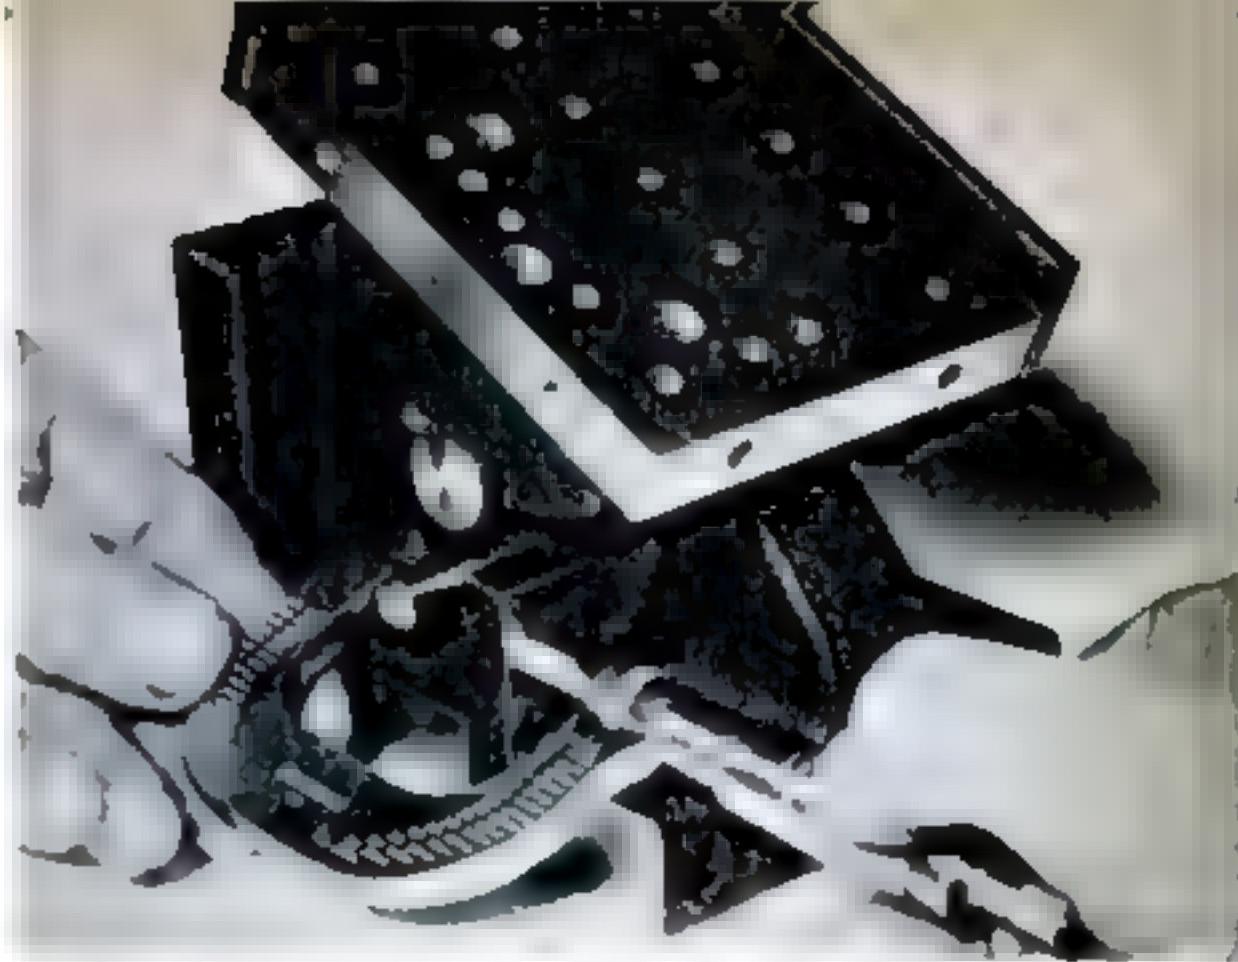

Chinese connoisseurs following the green-gold rush were quick to buy this piece for postwar shipment

Characteristically odd in shape and color is this nugget picked up by a Wyoming "rock hound"

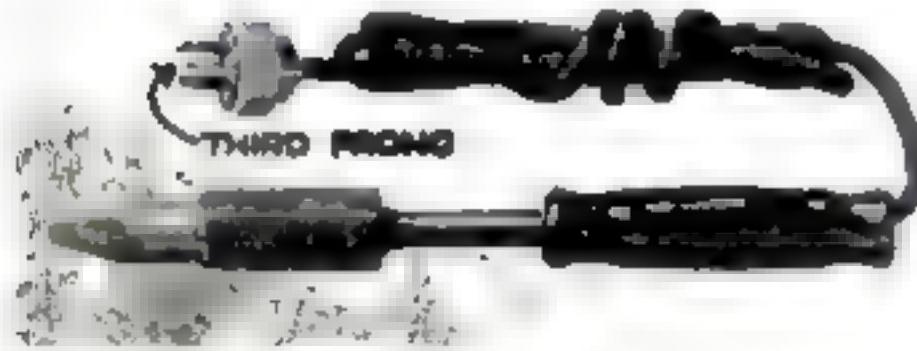

new Tools

ACCURATE ANGLES to 90 degrees may be set or measured quickly with the aid of the Bernisine, a toolmaker's accessory with provision for holding small work pieces for grinding, machining, and inspection operations. The Bernisine needs only a two-inch-capacity micrometer and the standard table of sines and cosines to set any angle in its range in a minute of time and within an angular minute of accuracy. Illustration shows micrometer over a hardened measuring pin and block. When the work table is level, the distance over the pin and block is one inch; when it is tilted, the pin changes its distance proportionately.

A micrometer reading taken over the pin and block at any point (minus the one-inch constant) is the sine reading of the angle.

THREE-WIRE PLUG and suitable ground connections for electric soldering irons made by the Hexacon Electric Co., Roselle Park, N. J., minimize the possibility of shocks and blown fuses. Used only where three-wire outlets are available, the third prong establishes connection between the ground and the outer housing of the soldering iron.

SAWING OR FILING of metal, plastics, or wood may be done with the aid of a device called Saw-Chief, which is attached to any electric drill with a $\frac{1}{4}$ -in. chuck, or to a compressed-air line or flexible shaft. It is made by the Chicago Precision Equipment Company.

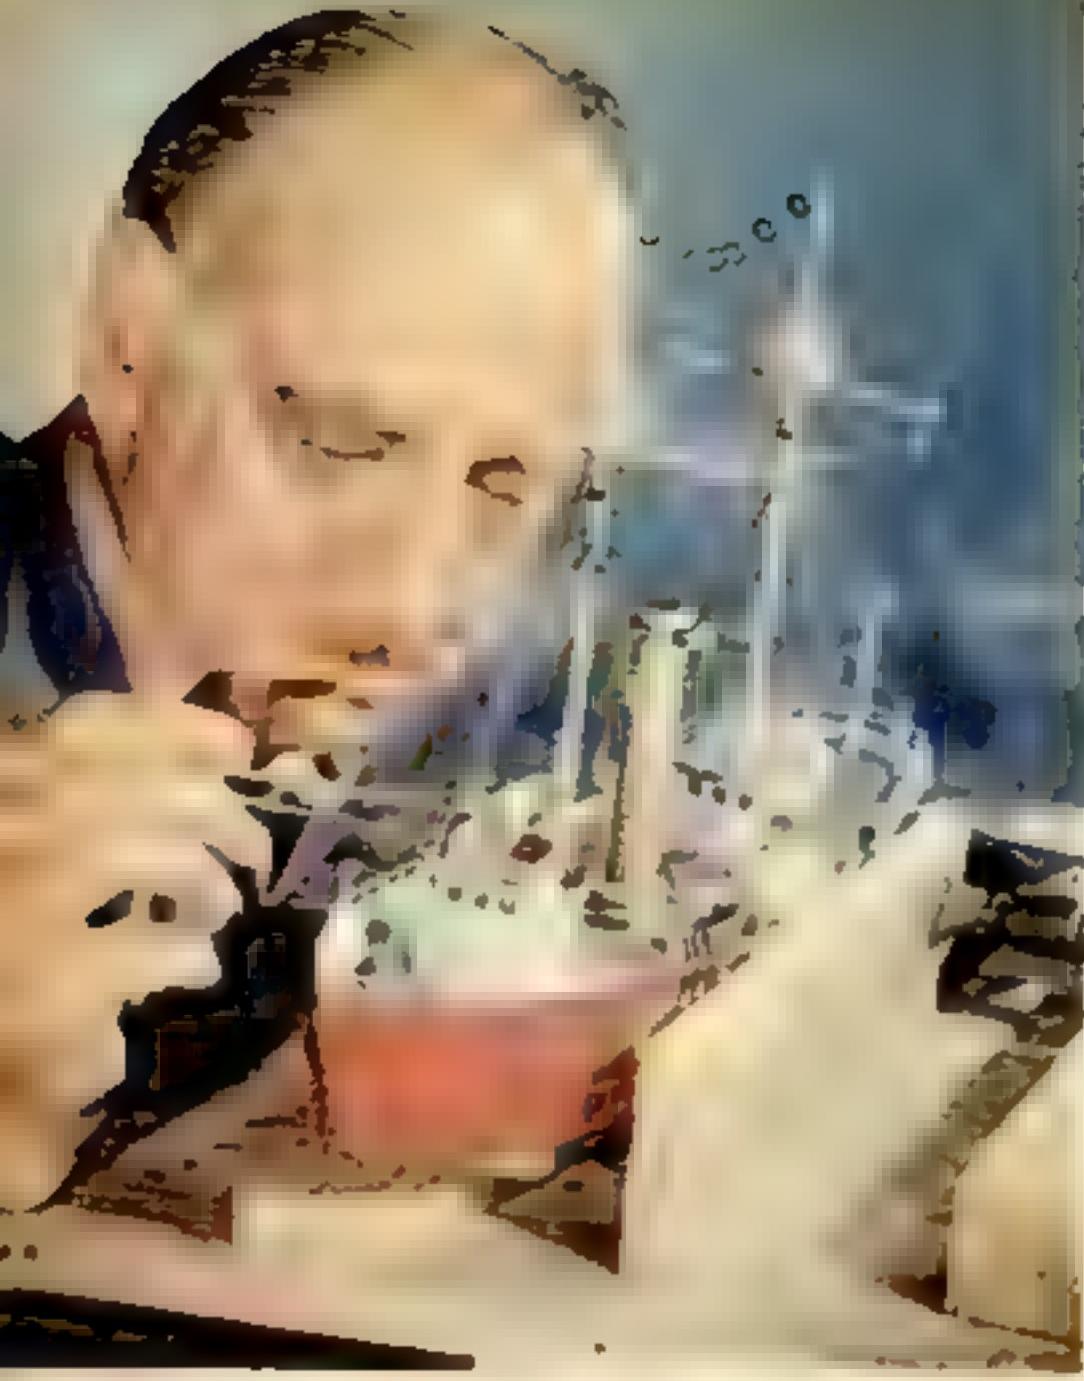

BROKEN DRILLS, formerly thrown into the discard, can now be used if one has a set of Drill-Savers, made by the C-B Tool Co., Lancaster, Pa. The broken end of the drill is slipped into a slot that compresses when the Drill-Saver is in a chuck, and two dimples, which ride in the drill flutes, hold the drill firmly against turning.

ENABLING PERMANENT REMOVAL AND REPLACEMENT OF BROKEN DRILLS

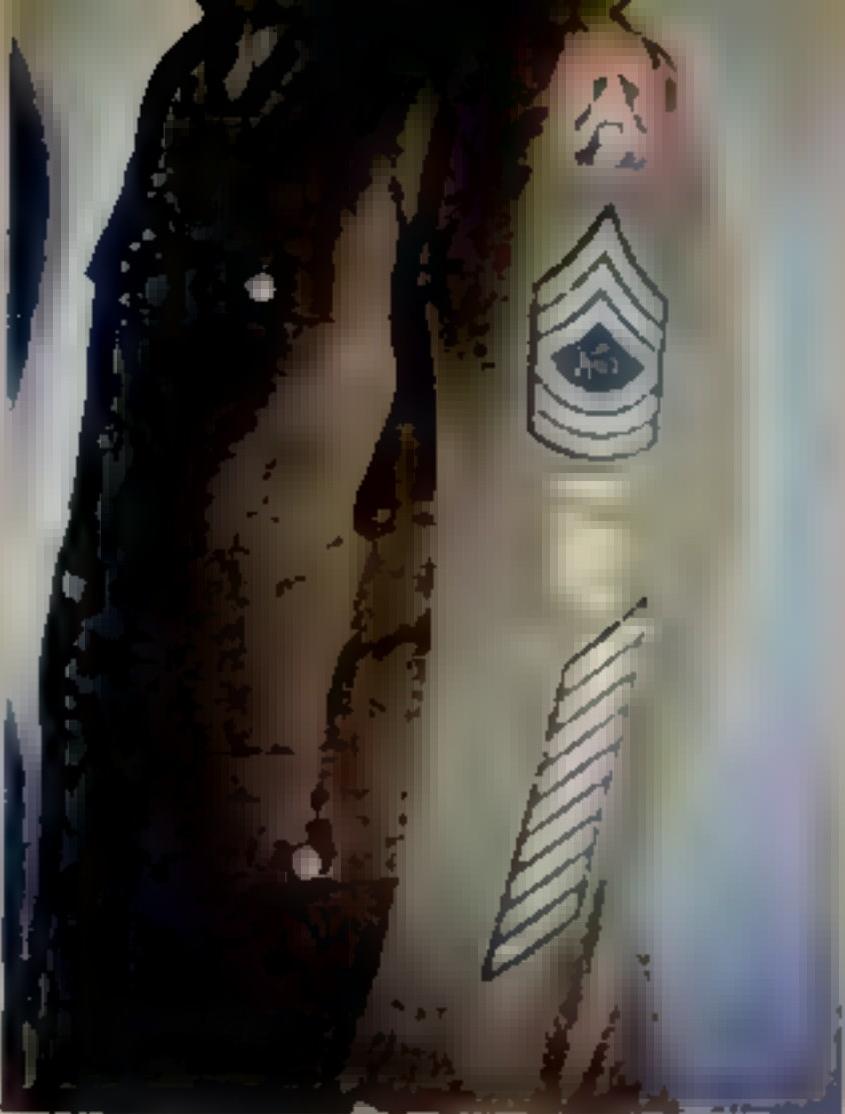

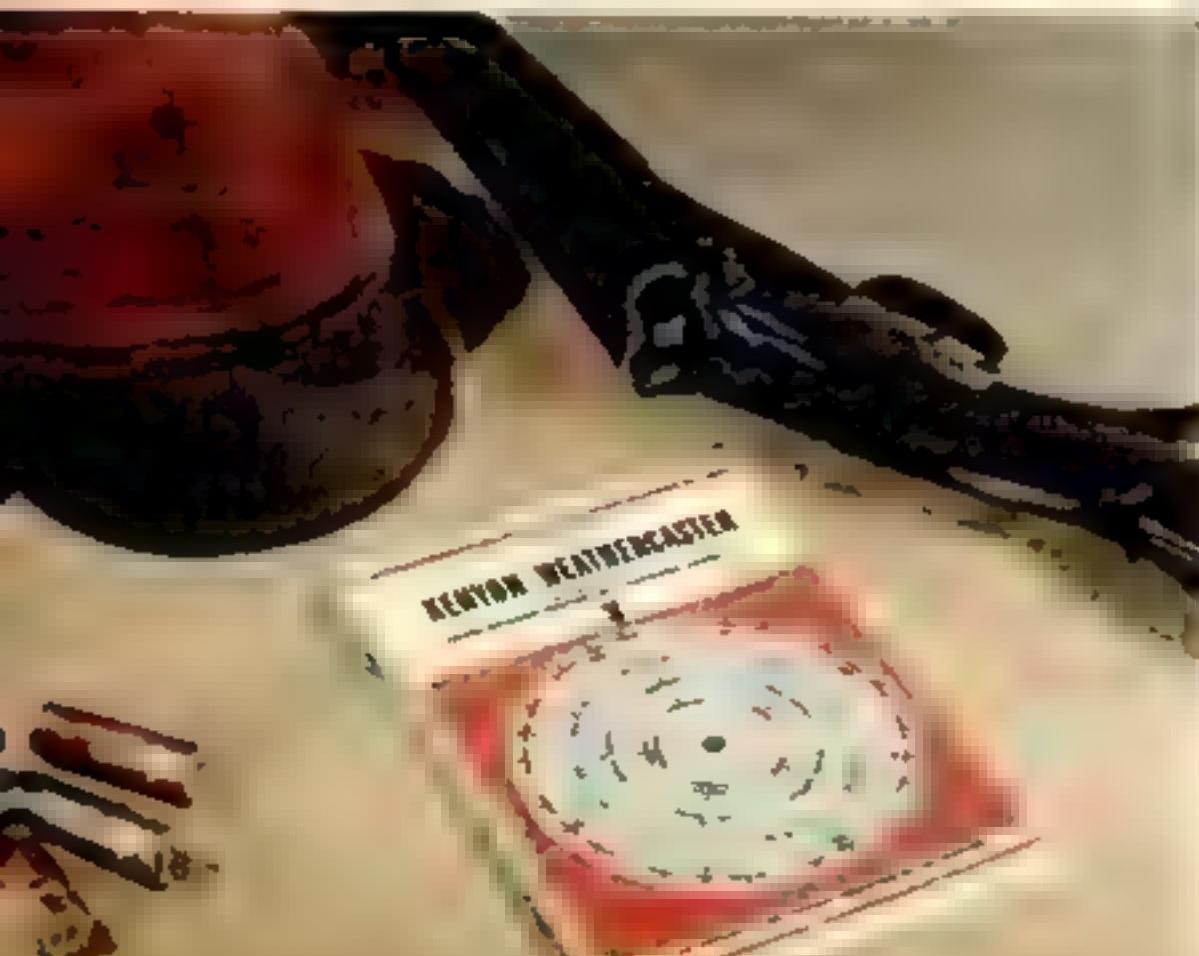

BROKEN DRILLS MOUNTED IN DRILL-SAVERS

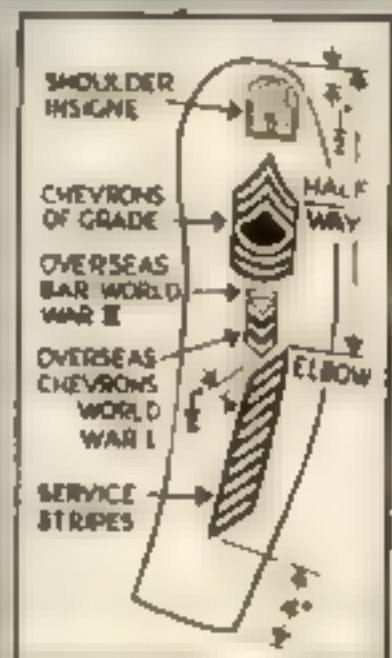

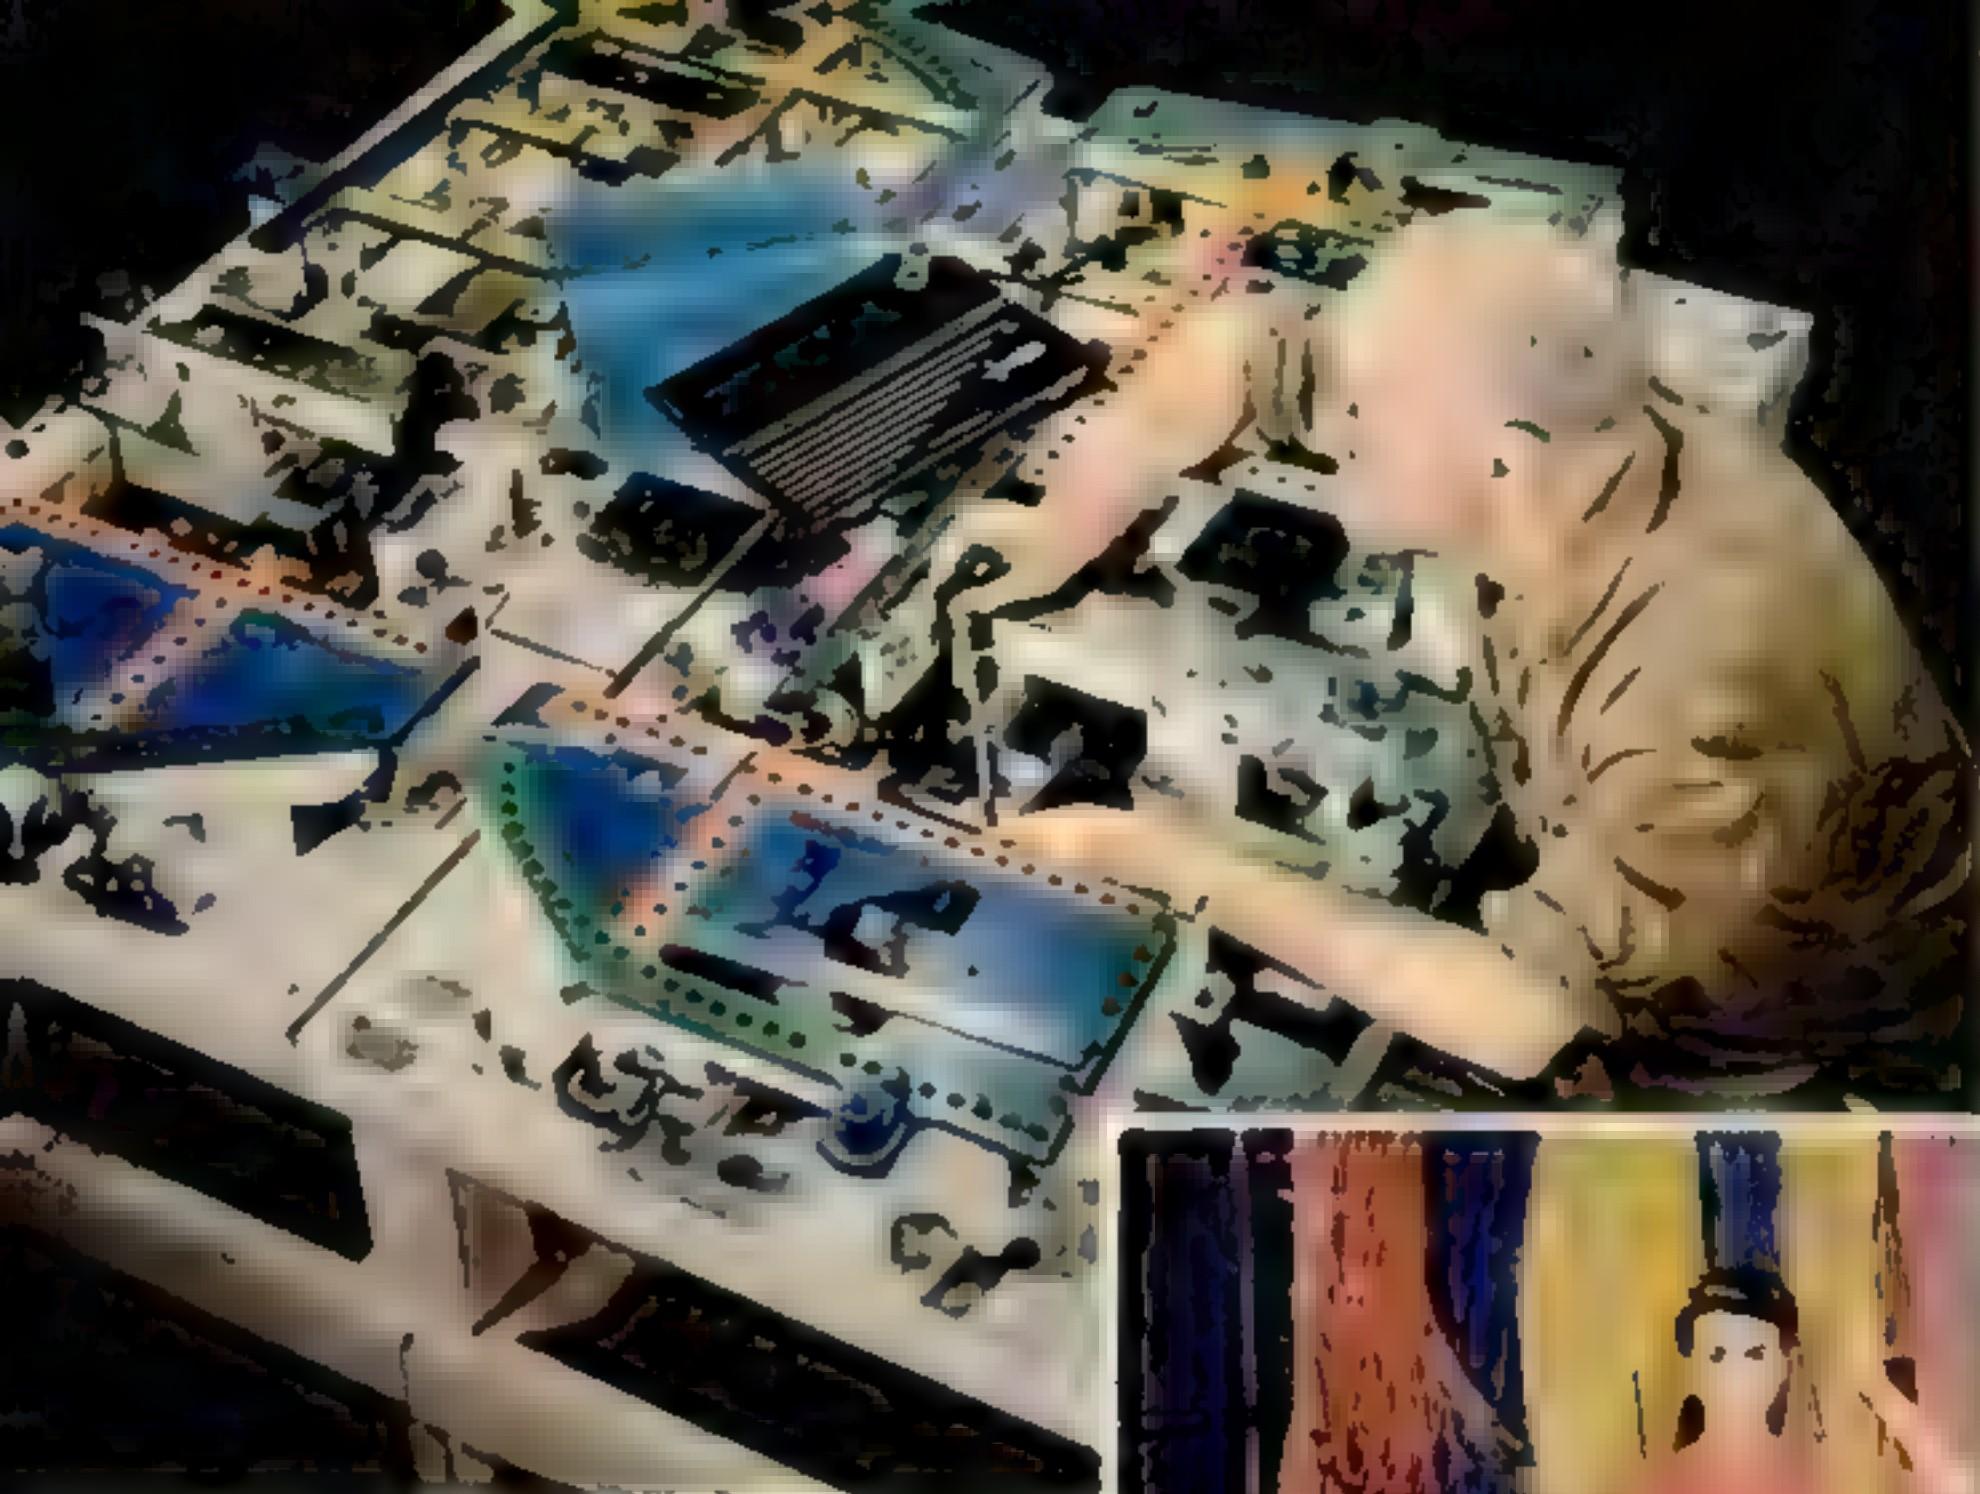

LIGHTSHIP MODEL, one of a ship series that will appear in an identification film, reproduces in miniature one of the U. S. Coast Guard lightships that are used on the Columbia River in Oregon and Washington. So nearly complete is the model that the smallest visible detail is included. The single funnel is even equipped with faithfully reproduced fog horns. The man who made the model is Fred Malatesta, who has done similar work for George Pal Productions, Inc., Hollywood, Calif. The board set up beside the ship model was placed there purposely to hide the name on its side for reasons of military security.

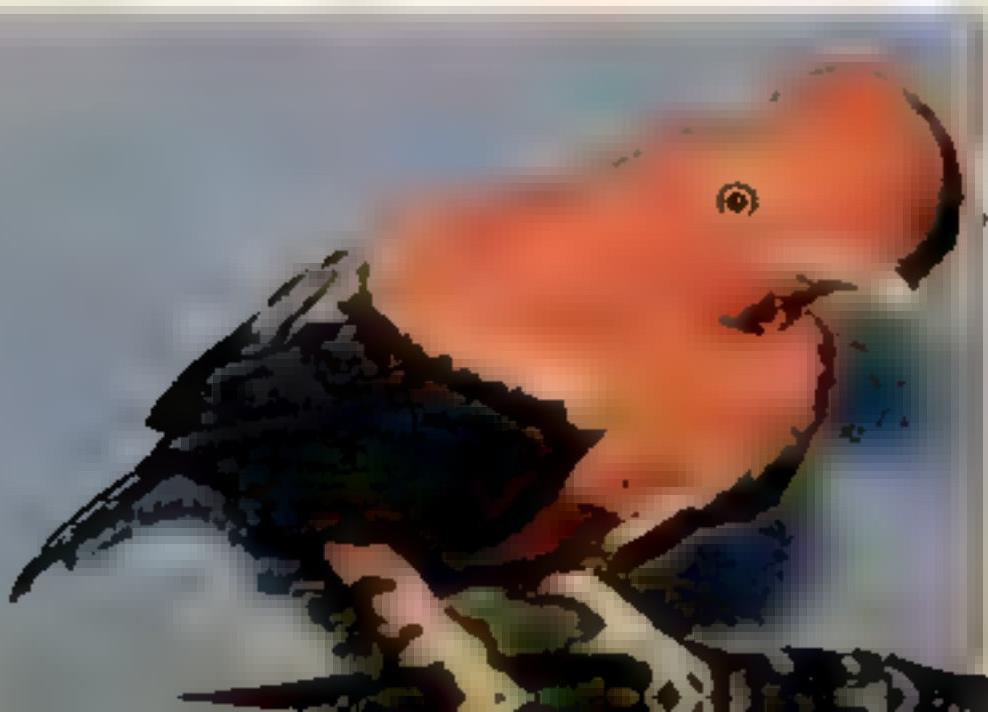

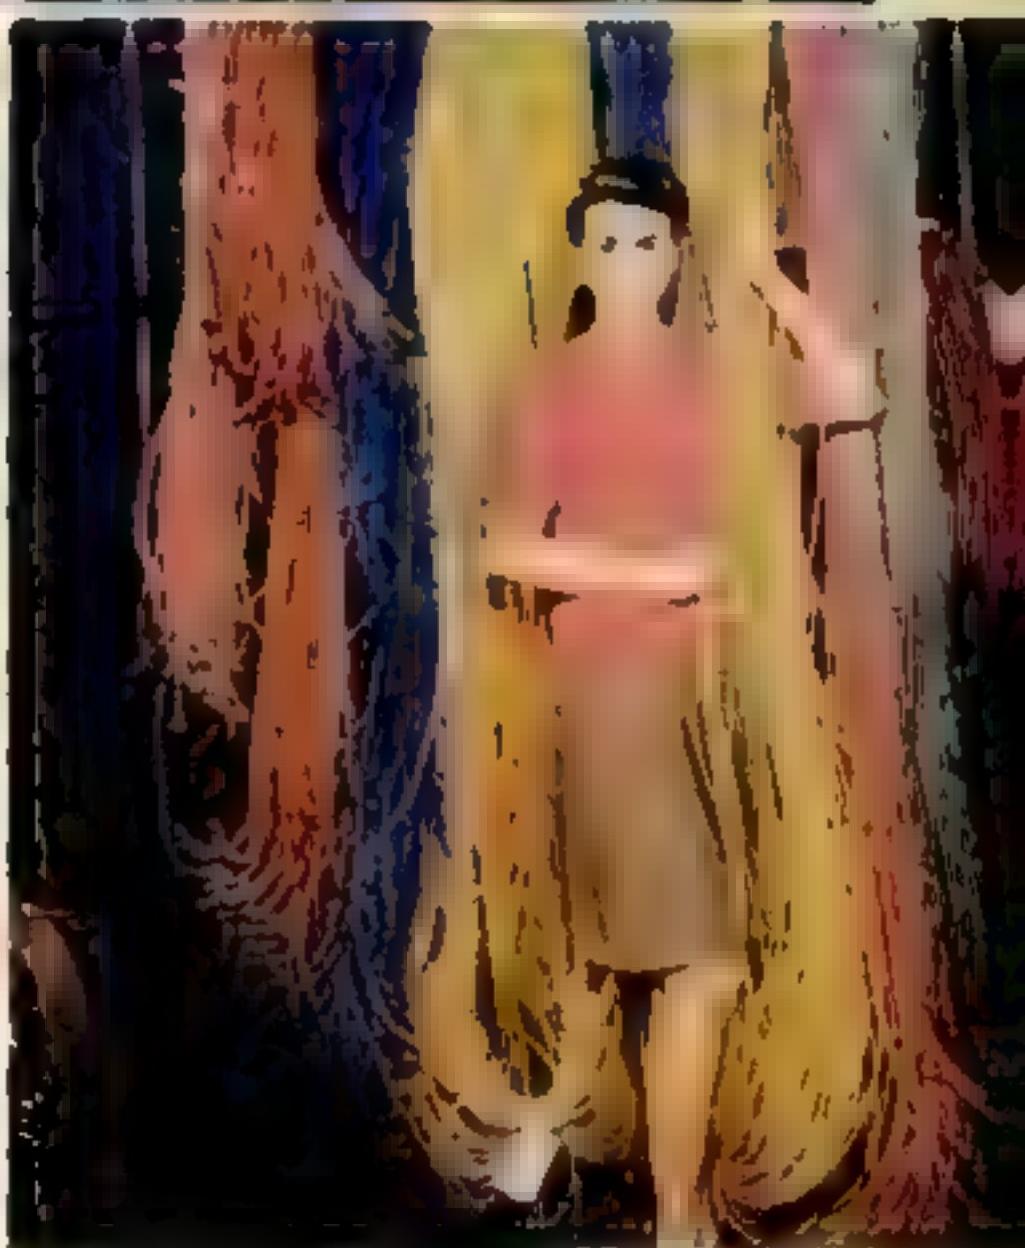

GOLDEN BAR, shown just below master sergeant's chevrons, is a new device authorized by the War Department to indicate each six months' service in the Army outside the continental limits of the United States. For purposes of the award, Alaska is included in its scope. Nine diagonal stripes at lower end of sleeve indicate 27 years of service. These insignia might seem to rate salutes from a general or even a second lieutenant.

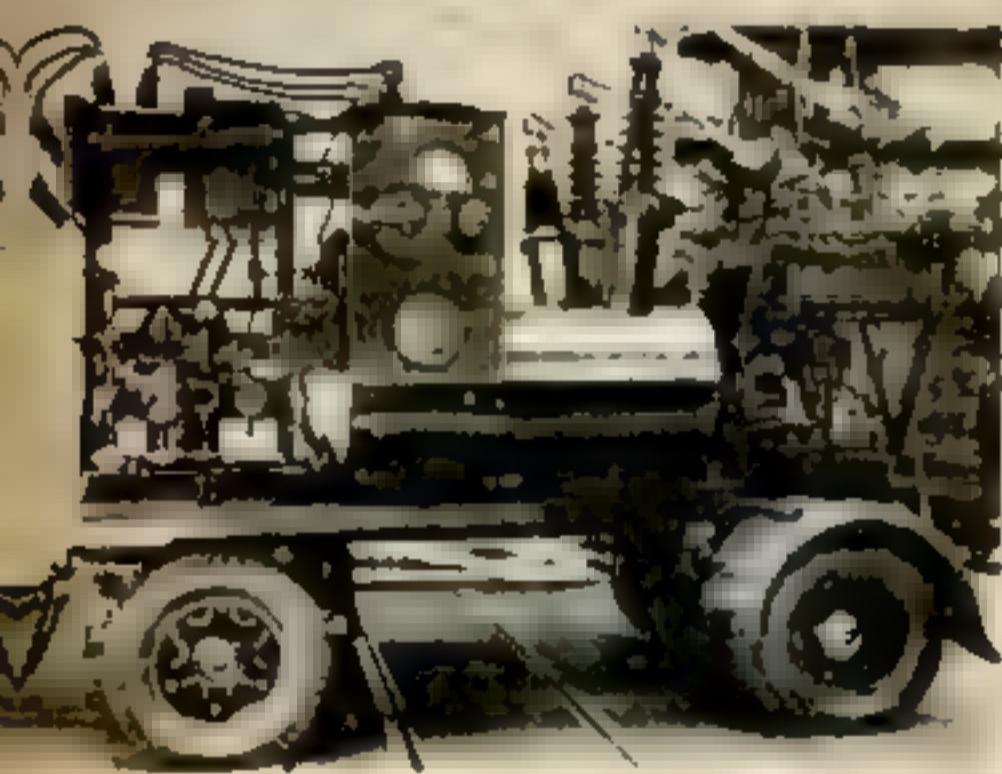

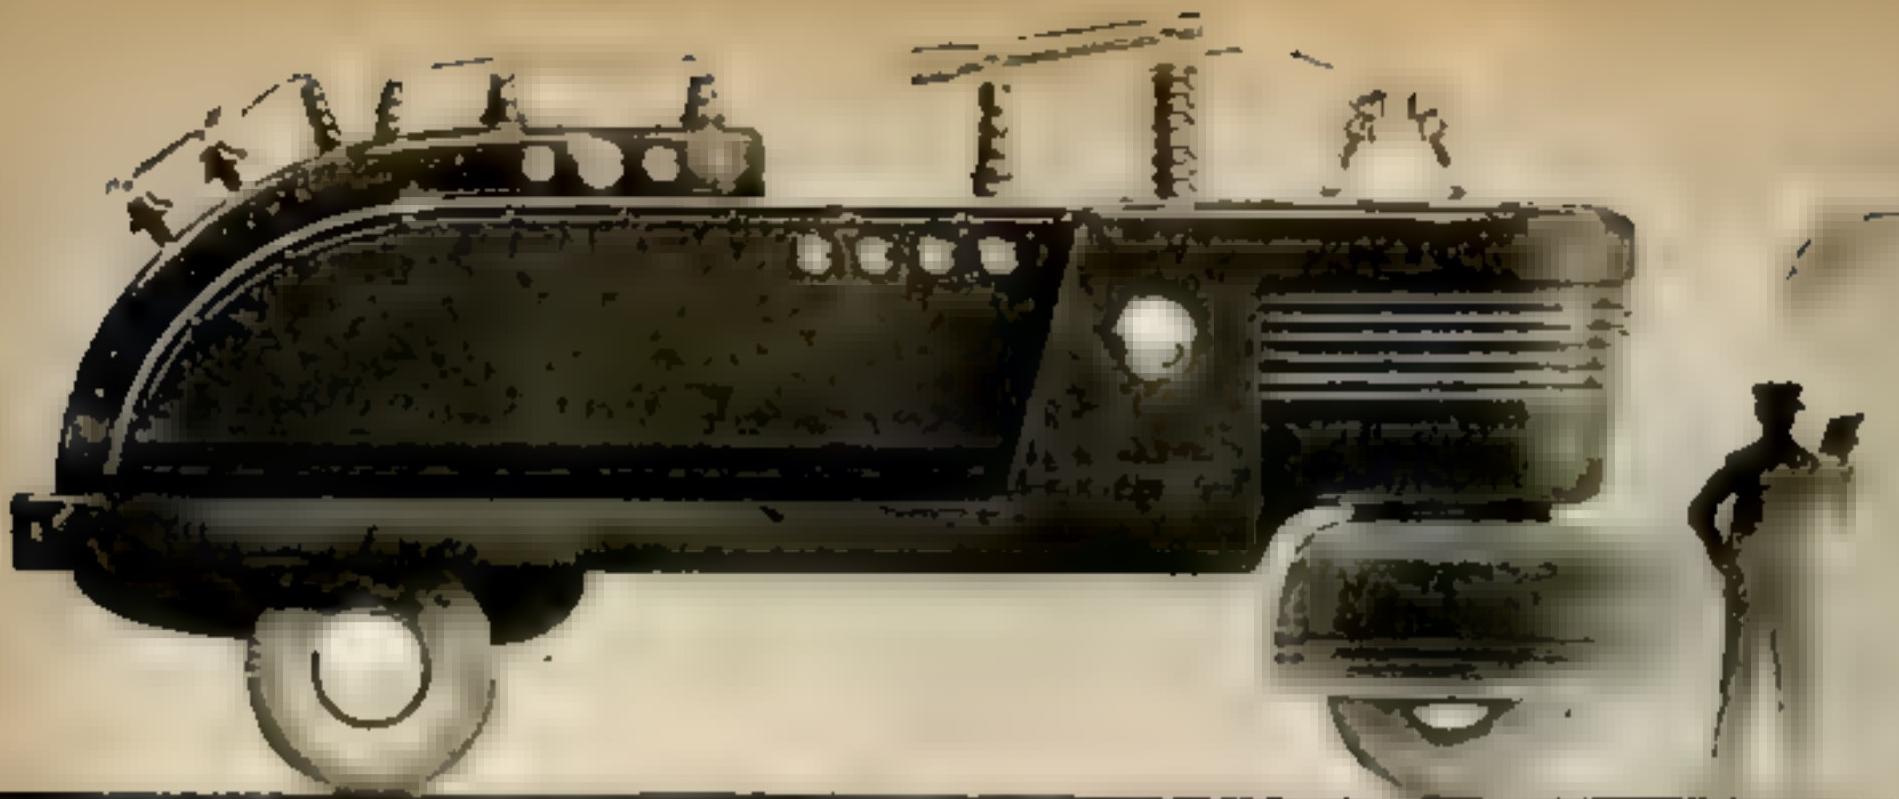

DIAL THE WEATHER if you're planning a trip. An improved model of the Weathercaster, recently put on the market by the Kenyon Instrument Co., Huntington Station, N. Y., predicts weather conditions with some accuracy as far as a day ahead. It consists of an instruction book with four movable graduated disks of successively larger diameter on the cover. With reference to barometer readings and the direction of the wind, simple adjustments of the disks will reveal what may be expected.

COLOR SPEEDS PRODUCTION in plants making war materials. The Kodachrome above shows a toolmaker at Northrop Aircraft, Inc., Hawthorne, Calif., reworking an inner wing-frame assembly jig for a Black Widow. The colors are used to indicate the different drill sizes necessary for the job. Also guided by color, young women at Electric Auto-Lite Co., Port Huron, Mich., make the complicated wiring setups for war vehicles. These ignition harnesses are assembled from racks holding miles of varicolored wire, cut to size and with terminals soldered on. A complete harness may require more than two dozen wires, each a different color and sometimes as long as 30 feet. Not only must the right wires be selected, but they must be assembled so the terminals stick out in the right places.

A RARE BIRD, and a beautiful one, too, is the scarlet cock of the rock, of South America. It is native to the rainy uplands of the Ecuadorean and Colombian Andes. This male specimen, about the size of a small pigeon, is one of a pair recently brought to the National Zoological Park, Washington, D. C. The female's color is brown.

This mobile substation doesn't look much like the sleek, compact job at the top of the page. Yet mechanically they are the same, the only difference being that the newer version has been streamlined and has a better parts arrangement. From the point of appearance, the old model looks powerful, but gives no suggestion of its ability to move rapidly.

In restyling the common electric motor, one of the first pieces of electrical equipment to be revamped, General Electric evolved a pattern now followed by most motor manufacturers. The new trimmied Tri-Clad motors have a one-piece cast-iron frame and a cast-iron end shield which protect the vital parts from hard blows, falling objects, and liquids.

New Faces for Postwar Industrial Equipment

HEAVY electrical apparatus doesn't have to be ugly. In fact, it can't be, if it expects to find a market against the keen competition of the postwar world. Makers of durable goods, like the manufacturers of automobiles and home furnishings, now realize that their products must be easy to look at as well as efficient and economical in operation.

One of the leaders in this trend is General Electric. Under the guidance of Ray Patten, nationally known industrial designer, GE engineers are beautifying such pro-

BEFORE

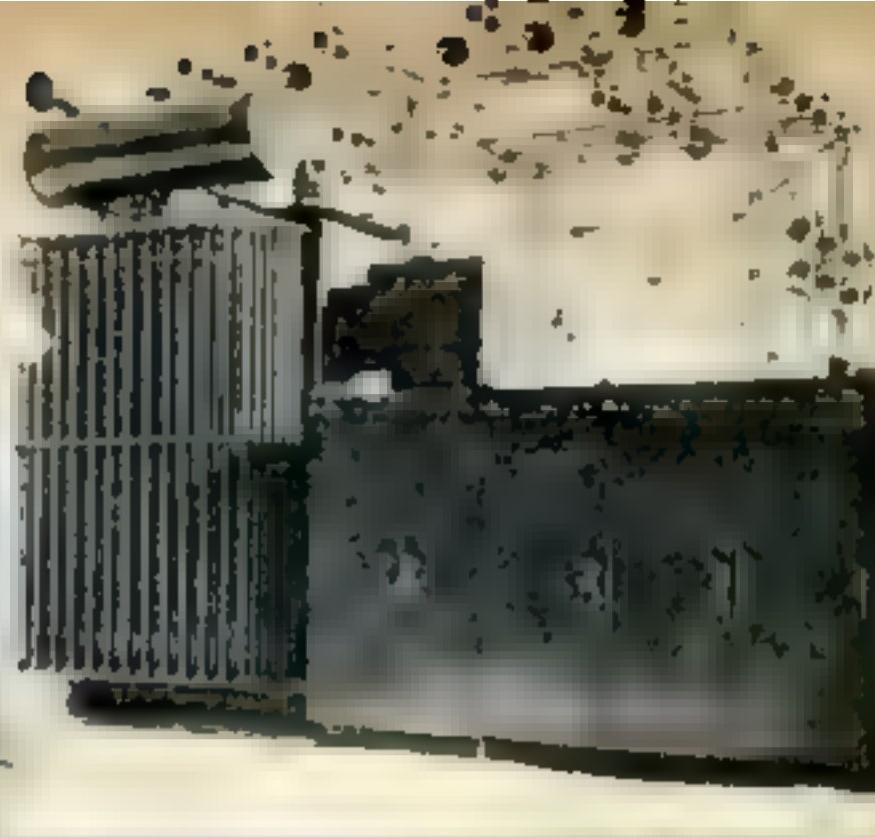

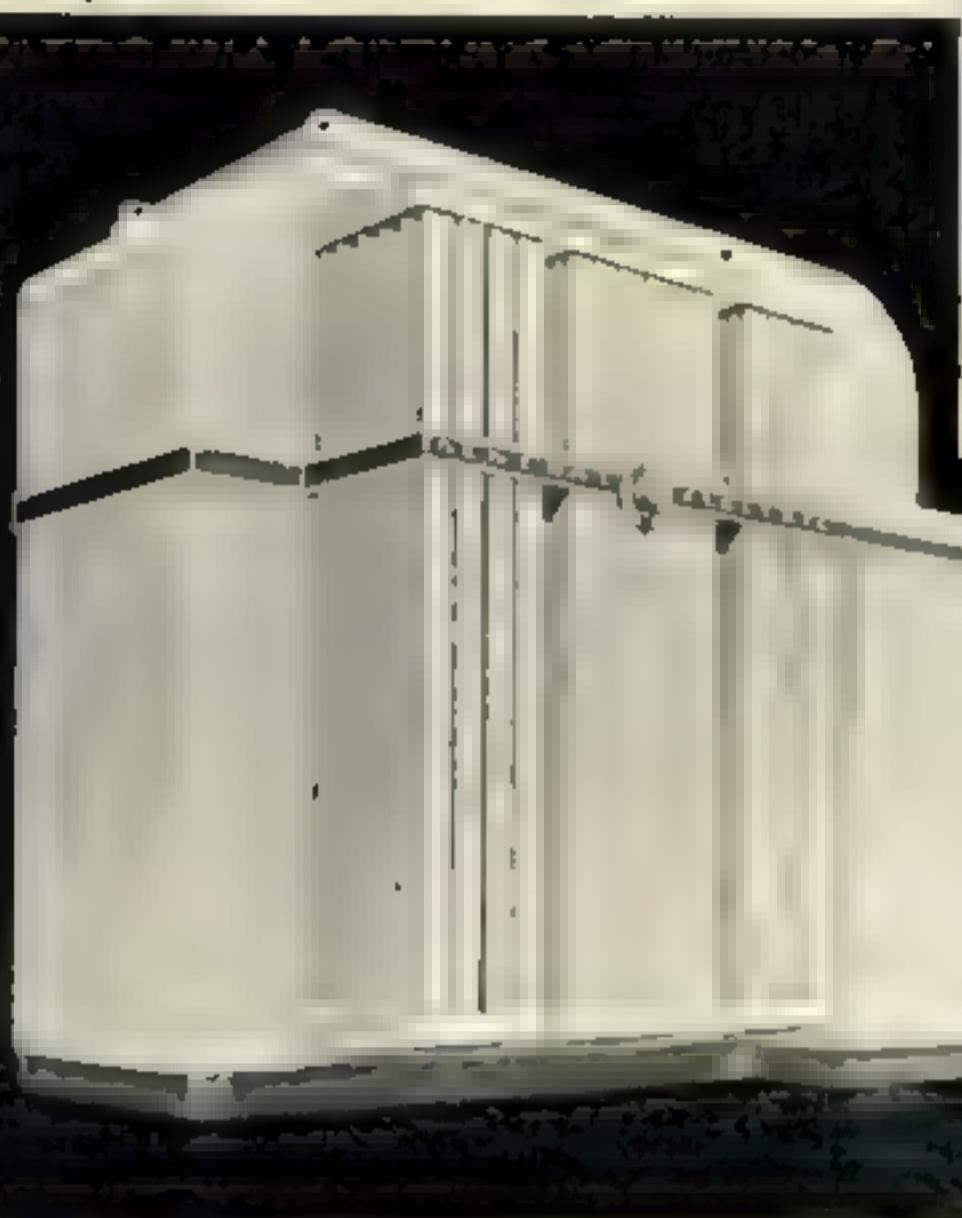

AFTER

In tidying up this unit substation, GE's designers, by bringing together the transformer and switchgear to reduce the over-all length of the unit, have achieved an unusual degree of unity and compactness. In place of the bewildering maze of overhead wires in old unit, new model provides for underground connections

basic items as electric motors, substations, locomotives, and transformers.

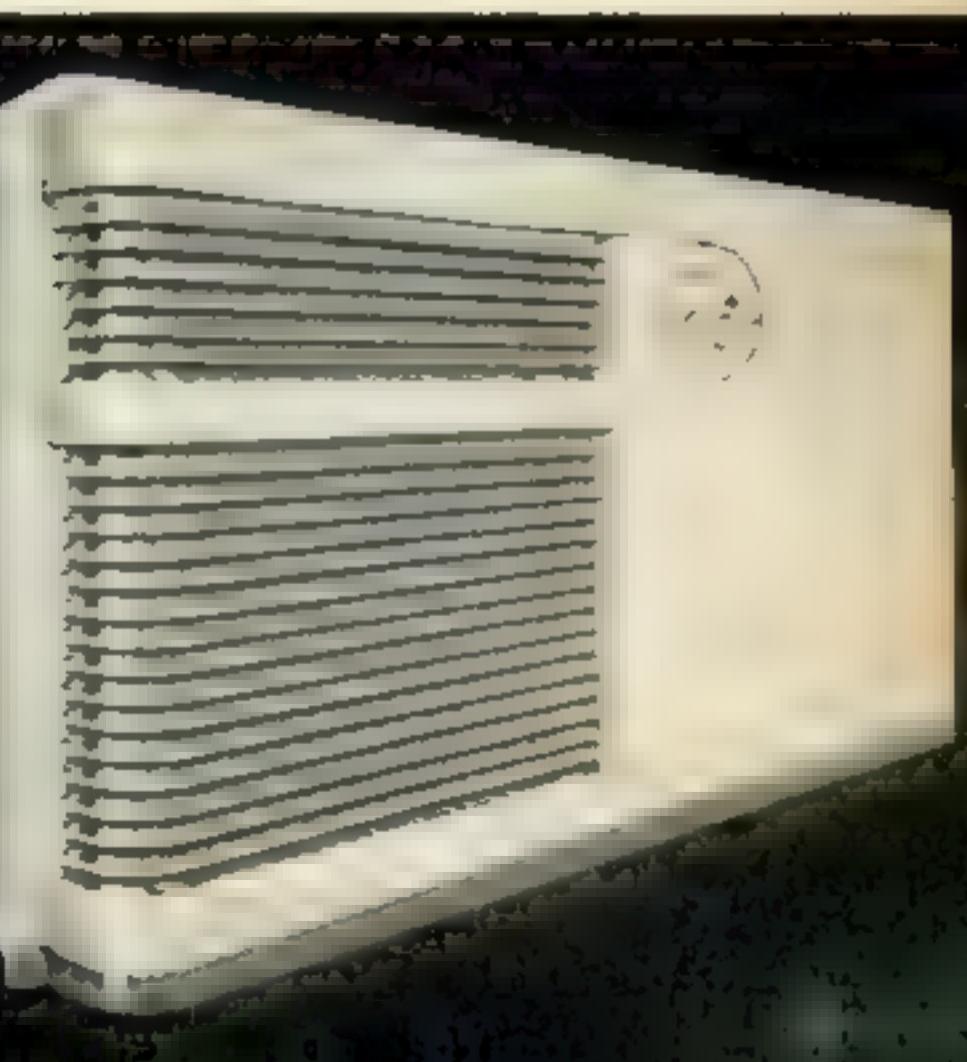

This new beauty isn't just skin deep either. In adding eye appeal to General Electric industrial equipment, Patten and his designers have revamped many products

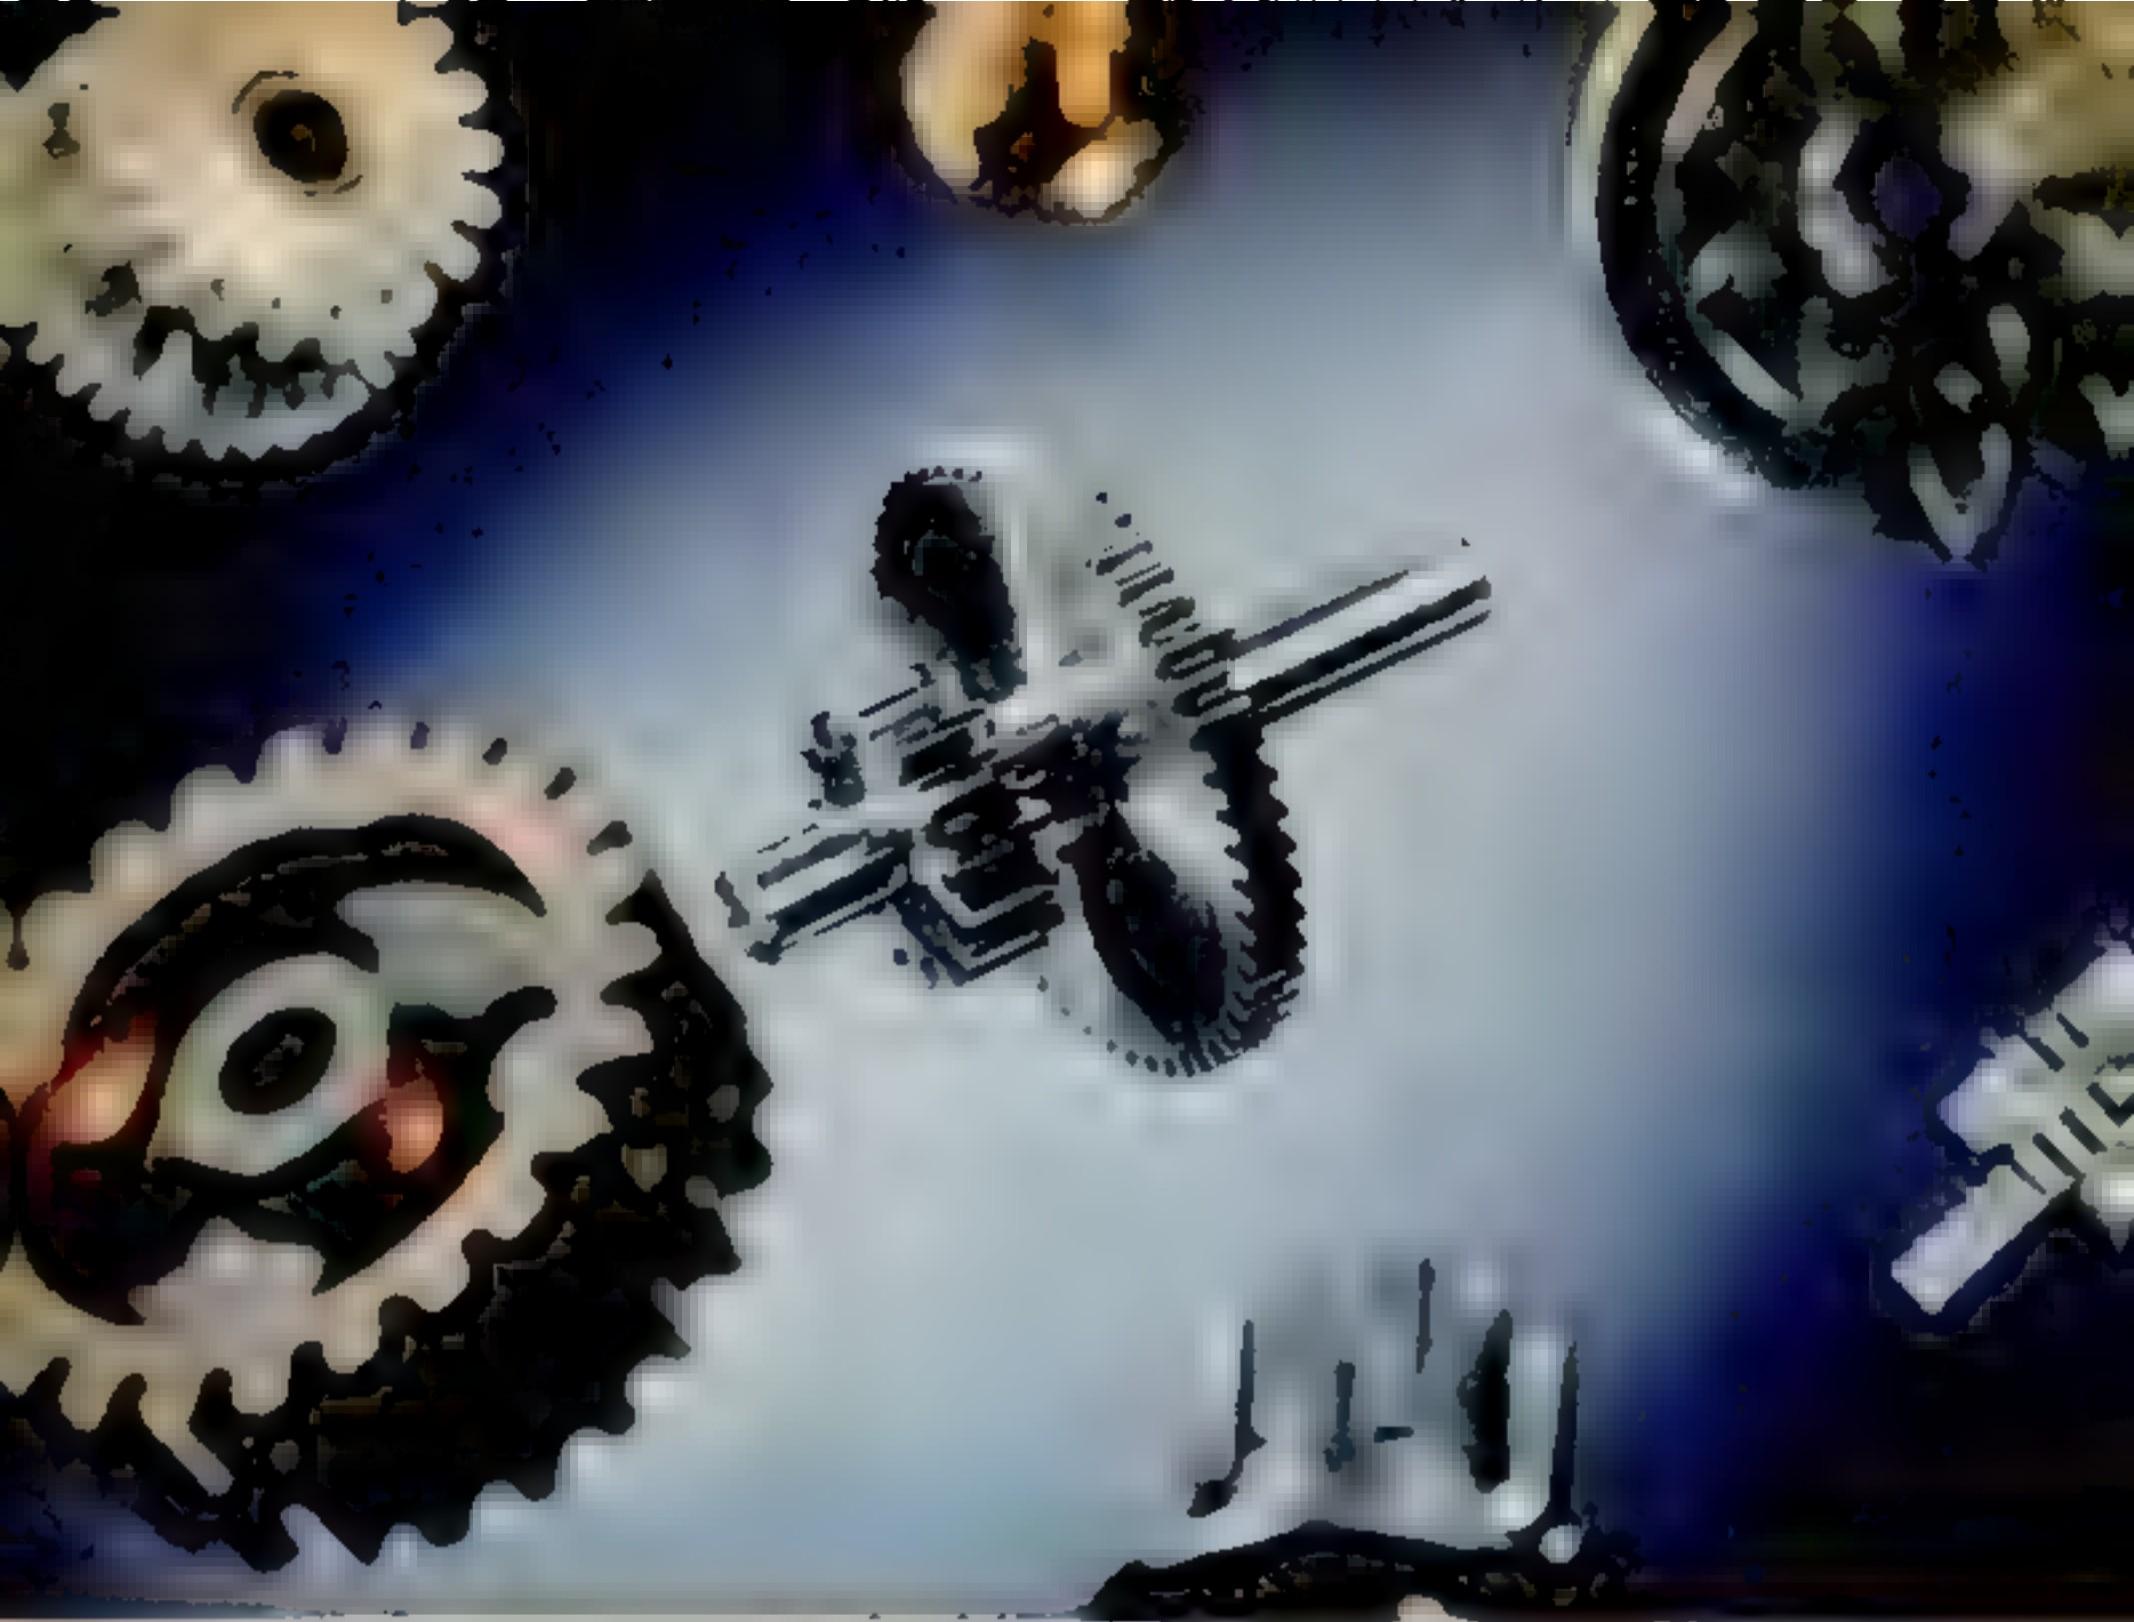

so that they weigh less, occupy less space, have a better arrangement of parts, require less materials, are easier to operate, are better protected, and in many cases offer better protection to the workers who will operate them.

While acquiring a prettier face, this dry-type transformer has also got rid of some excess weight. And, requiring fewer materials, it can now be sold at a lower price. Another important asset is that it provides much more safety

CLUSTER GEARS. When two or more gears are made in one piece, the combination is called a cluster gear. The one in the center, above, has two gears: the larger of one-inch diameter and 48 pitch; the smaller of half-inch diameter, 32 pitch

WHEELS That Can't Slip

Gears have been serving man for centuries. Now they reach their greatest refinement in the precision instruments that control many of our war weapons.

By VOLTA TORREY

Photographs by ROBERT F. SMITH

GEARS ARE DESIGNED TO DO A VARIETY OF JOBS

TEETH of gear are shaped to eliminate the possibility of slipping. The increasing pitch of each tooth along the circumference insures that each tooth will be in contact with only one straight side of the teeth of the wheel.

INTERLOCKING gears mesh to eliminate slipping. Gears of different sizes mesh, giving smooth operation.

SUN gears mesh to eliminate slipping. Gears of different sizes mesh with a sun gear or wheel.

A HAIR perhaps," wrote the great mathematician and poet, Omar Khayyam, "divides the False and True." Less than a hair, in the gearing of an automatic pilot, bombsight or gun director, decides the twentieth-century soldier's fate.

Inside a single, modern, mechanical anti-aircraft gun director there are nearly 700 gears. Many of them must be within one four-thousandth of an inch of the engineer's specifications, if the gun aimed by this mechanical brain is to hit a diving, darting attacker. A four-thousandth of an inch is only one twelfth the average diameter of a human hair.

The marksmanship of an American fighting man is determined nowadays by the precision with which such gears have been made for him far behind the lines. And the mass production of extremely precise gears is a wartime achievement that marks another significant step in the evolution of revolving wheels.

The Egyptians put wooden pegs in the rims of crude wheels, so that an ox walking in a circle could raise water from a well. The transmission of power from one shaft to another is still the most common function of gears. But, thanks to many improvements, gears have also become a means of transferring measured motion within instruments that solve intricate mathematical problems hundreds of times as fast as a quiz kid could do it.

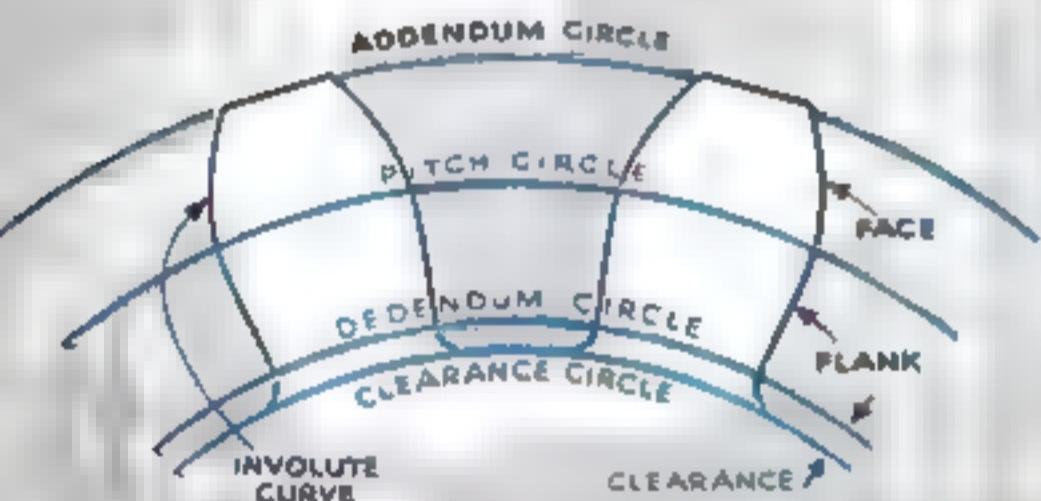

The first metal gears were made the ancient way, by setting pins in the rims of wheels. Then men learned to cast metal wheels with notched rims. Even so, if the teeth of those gears were within a thirty-second of an inch of the proper places, the makers congratulated themselves.

Some seventeenth-century mathematicians pointed out that gears could be made more efficient by curving the teeth geometrically. This was done at first by hand, and the precision of the gear depended on the workman's skill. Less than a century ago, machines were invented to cut curved gear teeth. Now those machines have been so perfected that they produce almost perfect gears.

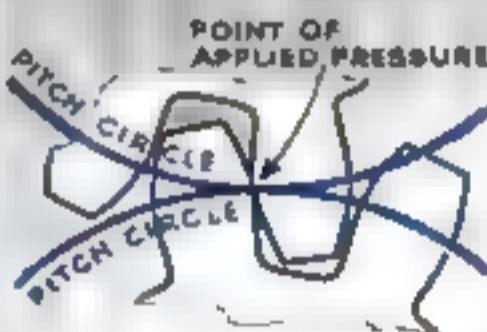

The teeth of these machine-made gears are as uniform as the balls for ball bearings. Differences in the spaces between the teeth are infinitesimal. Every tooth fits every niche in another gear as though each tooth and niche had been hand-tailored for each other.

Although often no larger than the gears in a watch, the gears in an intricate navigation instrument or gun director must mesh even better. Watch gears always turn in one direction at a steady speed. But the gears in the computing machines used to guide mighty weapons must alternately spin and creep, sometimes clockwise and sometimes counterclockwise. Hence, the least bit of backlash, or slackness in the gearing,

HERE ARE SOME TERMS USED IN DESCRIBING GEARS

ANATOMY OF A GEAR. These four circles fix the design of a gear. Engineers like to visualize a pair of meshing gears as two cylinders with projections and depressions that interlock, the pitch circles representing their theoretical surfaces.

PITCH CIRCLE Intersects the points of applied pressure, where there is a pure rolling action between matching teeth of a pair of gears.

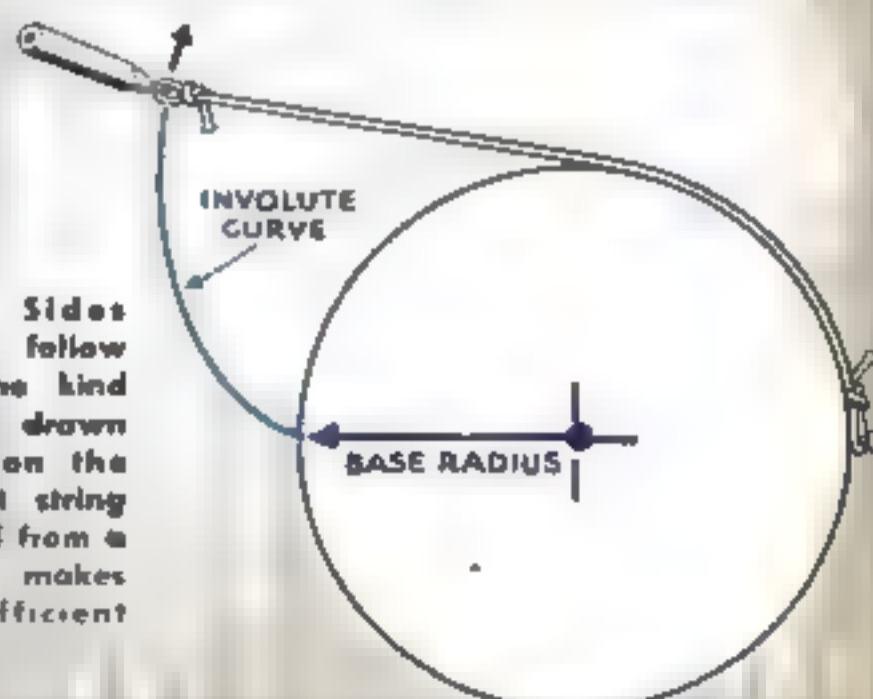

BACKLASH is play or slackness due to inaccurate fitting of teeth. Not a good thing in precision instruments.

DIAMETRAL pitch of a gear is the number of teeth it has for every inch of pitch diameter. As shown at left, pitch diameter is the diameter of the pitch circle.

INVOLUTE. Sides of gear teeth follow a curve of the kind that would be drawn by a pencil on the end of a taut string being unwound from a spool. Curving makes gears more efficient.

HOW INGENIOUS MACHINES MAKE FINE-PITCH GEARS

would lessen the accuracy of the calculations made by the mechanism.

There is so little backlash in the gears now being made in wholesale quantities for such instruments that it cannot be seen by the human eye or felt by the most sensitive of fingers. But it can be detected and measured by extremely sensitive instruments; by repeatedly testing each gear with these instruments, this looseness is held to a minimum.

Assume, for a moment, that you had an endless row of these modern gears, each of which was four inches in diameter and had 192 teeth. If the gears were correctly mounted on separate shafts, and you had someone hold the first gear stationary, you would have to go down the line to the 50,264th gear before the accumulated backlash would permit you to revolve one. You would then be more than three miles from your starting point.

Wheels with such excellent teeth are called fine-pitch gears. Their function is to impart dial or indexing motion from one shaft to another. In many modern instruments, this is done to govern the movements of the fine-pitch gears' brawny brothers, the power-transmission gears. Fine-pitch gears, consequently, are often literally the bosses of cruder but heavier gears.

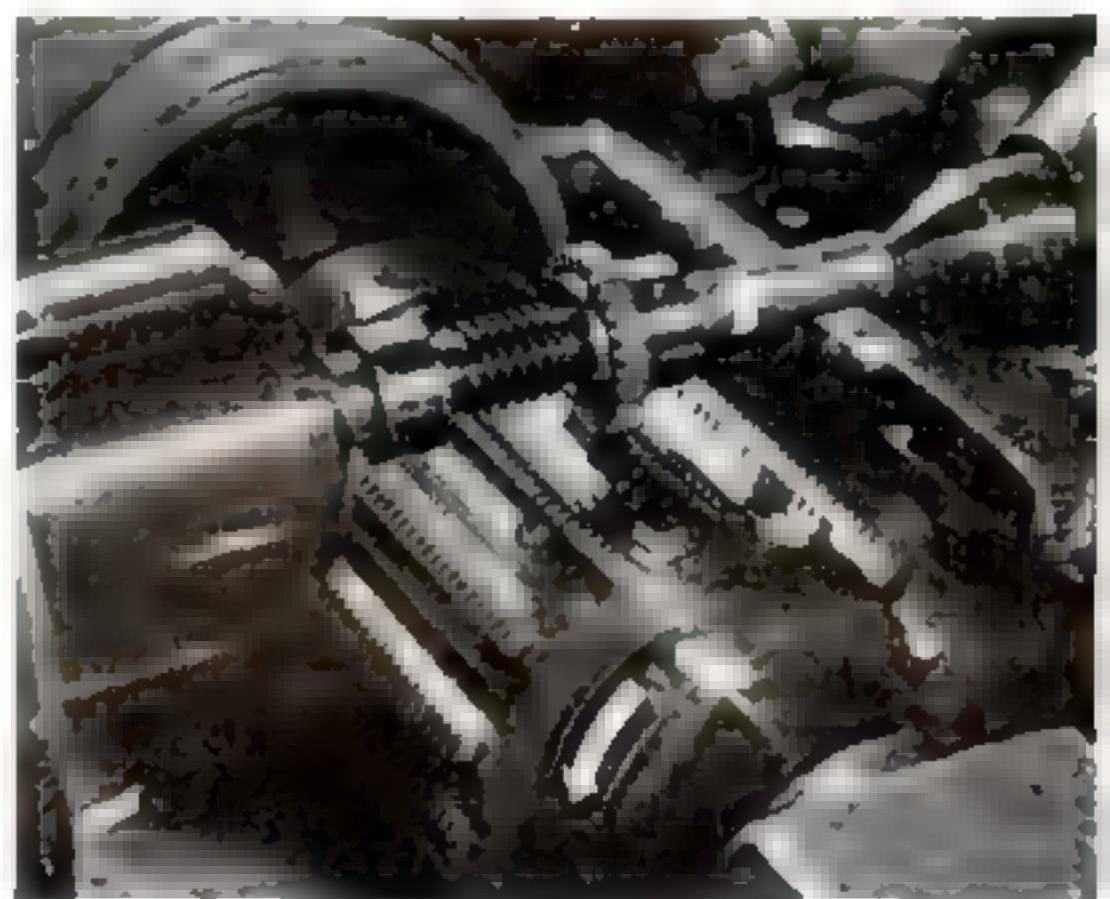

Although each tooth of a fine-pitch gear is really a cam, it must be almost exactly like every other tooth. Suppose, now, that you had two of these gears, each containing 50 teeth, making three revolutions a second. There would then be 9,000 engagements and disengagements per minute between teeth, and the slightest variation in teeth would cause a fluctuation in the motion transmitted from the first shaft to the second shaft.

The sides of every tooth are so curved that these engagements and disengagements are made smoothly at any speed. The curve is usually an involute curve, which means that it is the kind of curve that would be traced by a pencil on the end of a taut string being unwound from a spool. Although the teeth of a tiny, fine-pitch gear often look perfectly straight, each side of each tooth curves this way.

Nevertheless, the delicate carving necessary to shape each of the many teeth of these gears properly is done in a few minutes by modern gear-cutting machines. These masterpieces of the machine-tool maker's science, moreover, can be operated by women who cannot

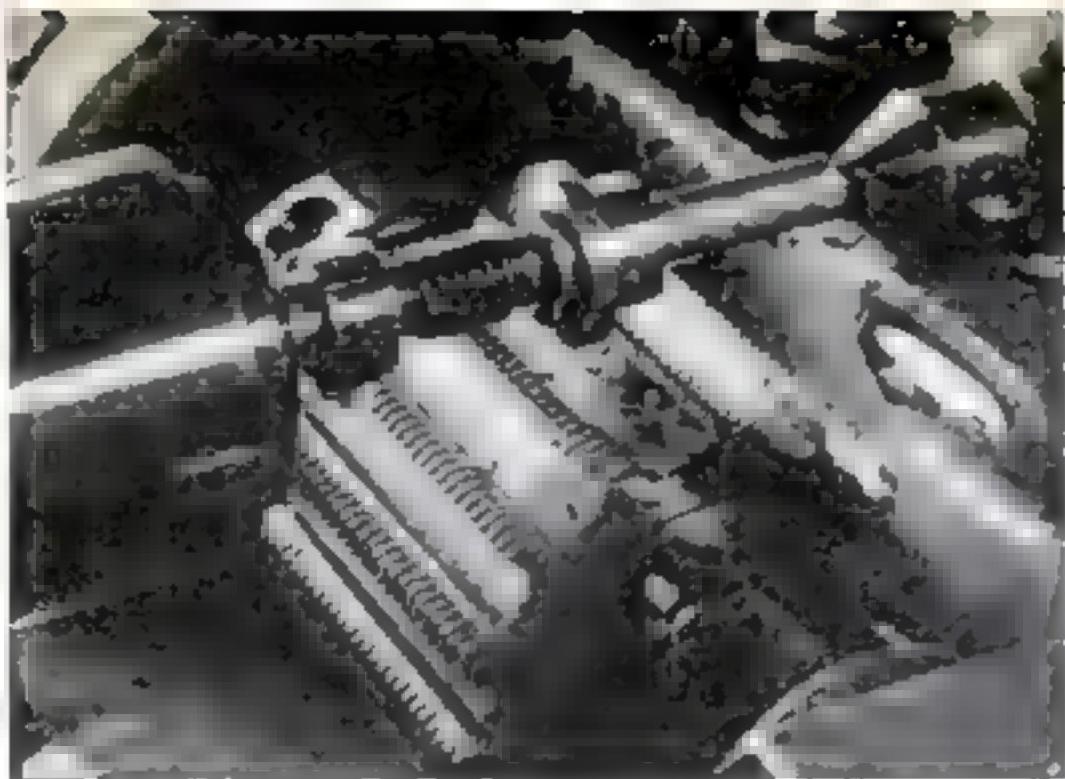

BLANKS for gears, cut from a solid rod of metal, are bored, reamed, and formed to size on this machine. Photo shows drilling; note boring tool poised ready for next operation. The sequence is controlled by cams

This is the completed gear made by the hobbing method. The machine shown in this picture and the two at the top of the opposite page is a Barber-Coleman No. 3. All arrows on pictures show the directions of rotation

HELICAL SPUR GEAR is cut by another hobbing operation. In this case, the teeth of the gear are cut at an angle by holding the blank with its axis at an angle to that of the hob rotating underneath it

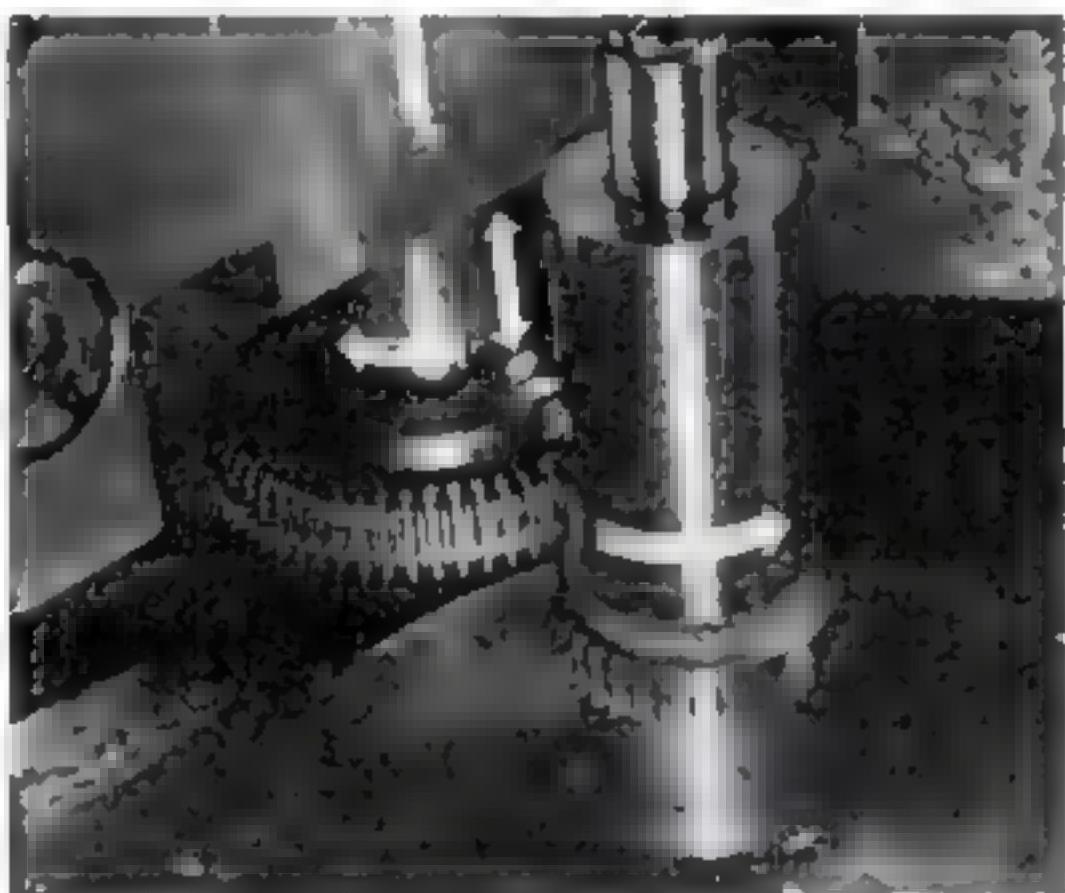

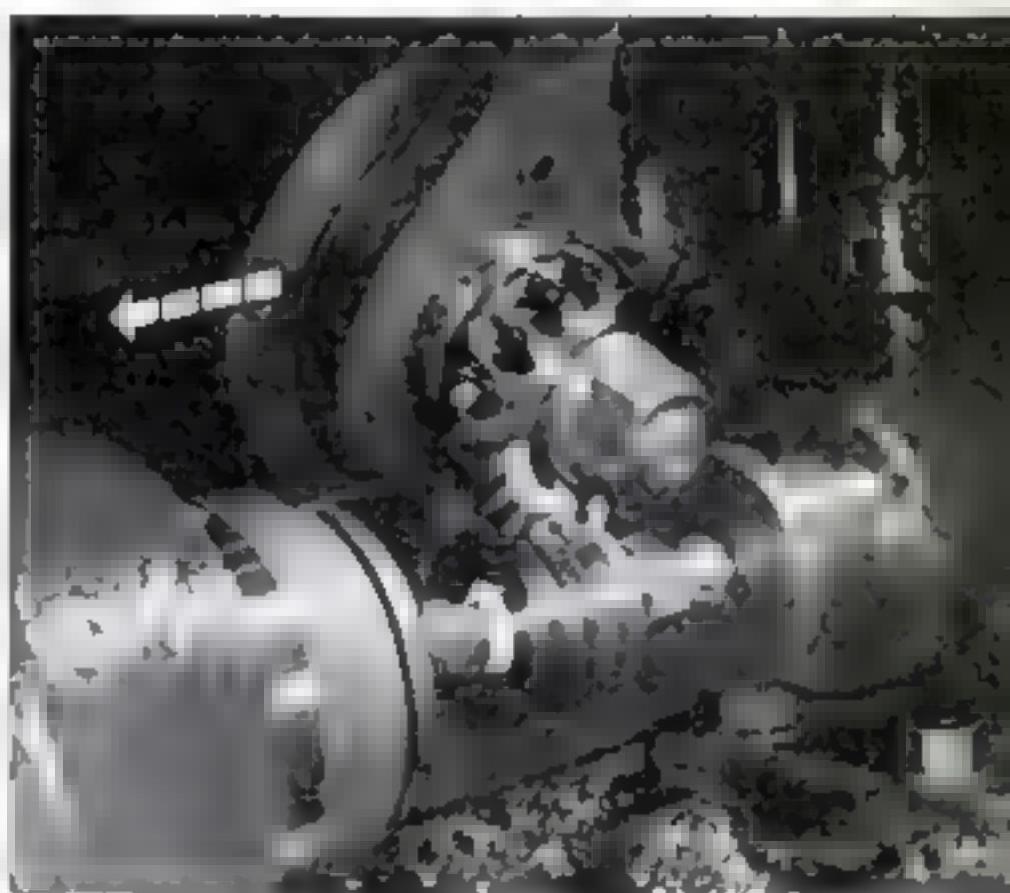

HOBBING is one method of cutting teeth in the rim of a blank. Here the blank is seen mounted above the hob, which is a cylinder bearing cutting blades in the form of a worm. Hob and blank revolve simultaneously

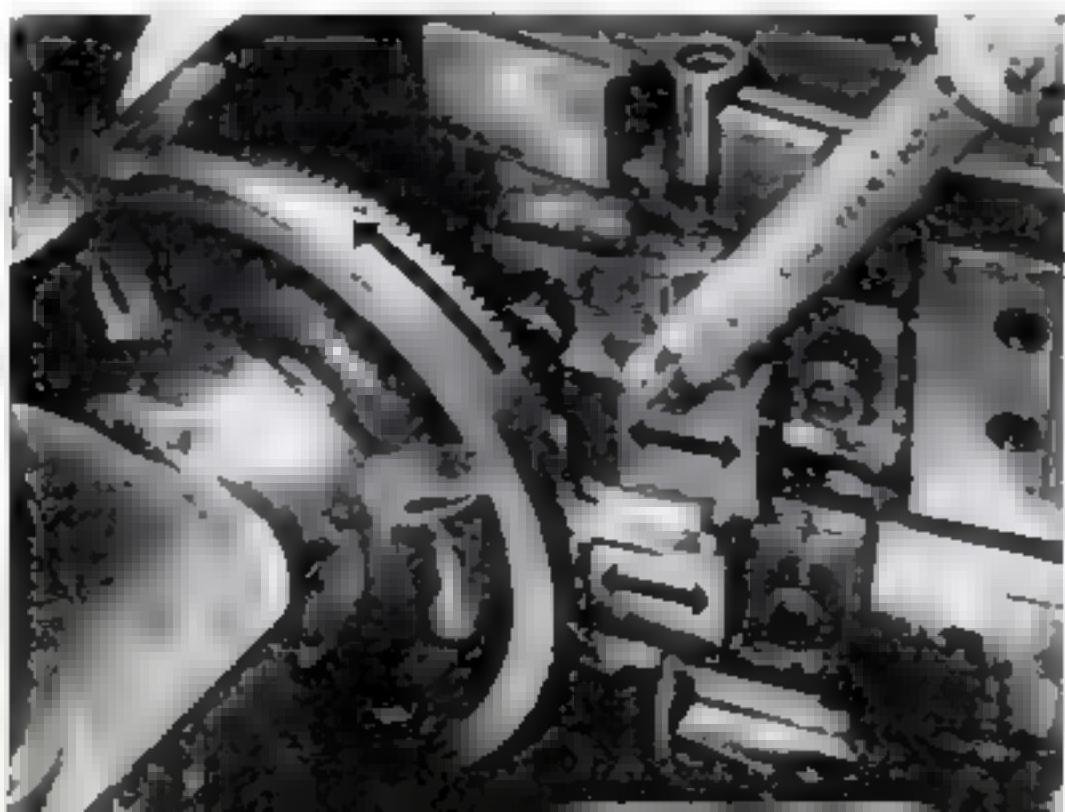

Cutting takes place in a stream of oil. The relative rotating speeds of the hob and blank are determined by gearing. By changing this gearing, the same machine can be used for cutting a wide variety of gears

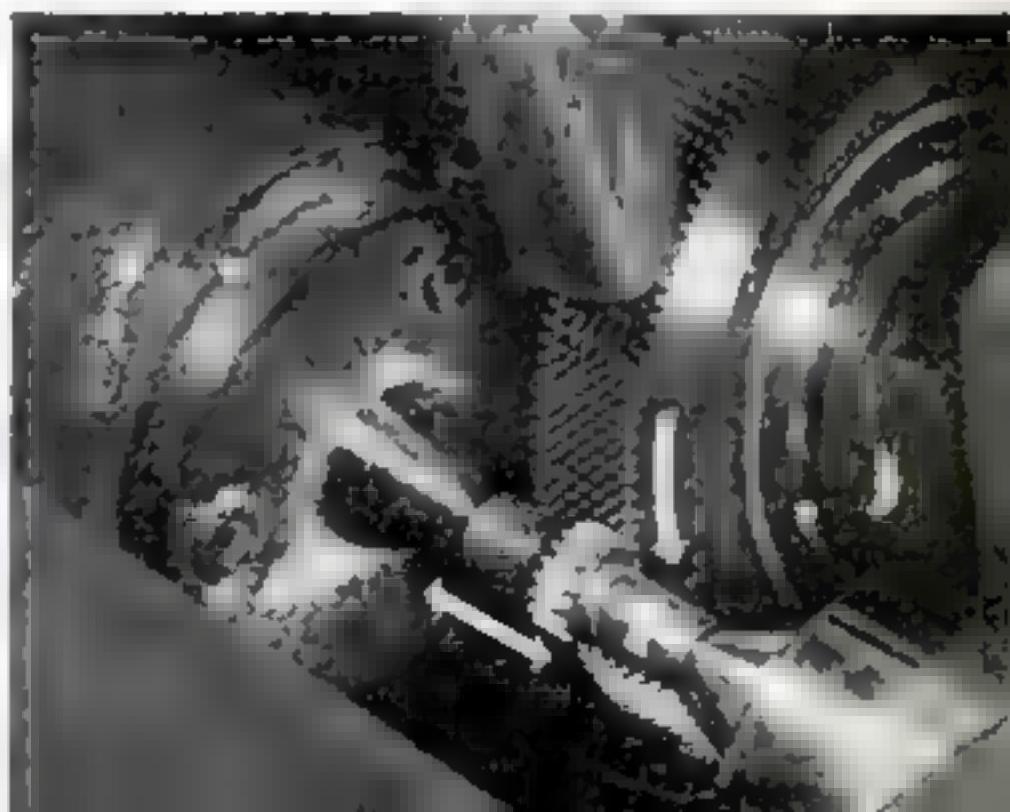

FELLOWS process shapes gear teeth by planing action. The cutter (at left) has teeth resembling those desired in the blank. Rotating with the blank, cutter feeds slowly into the work until all the teeth are cut

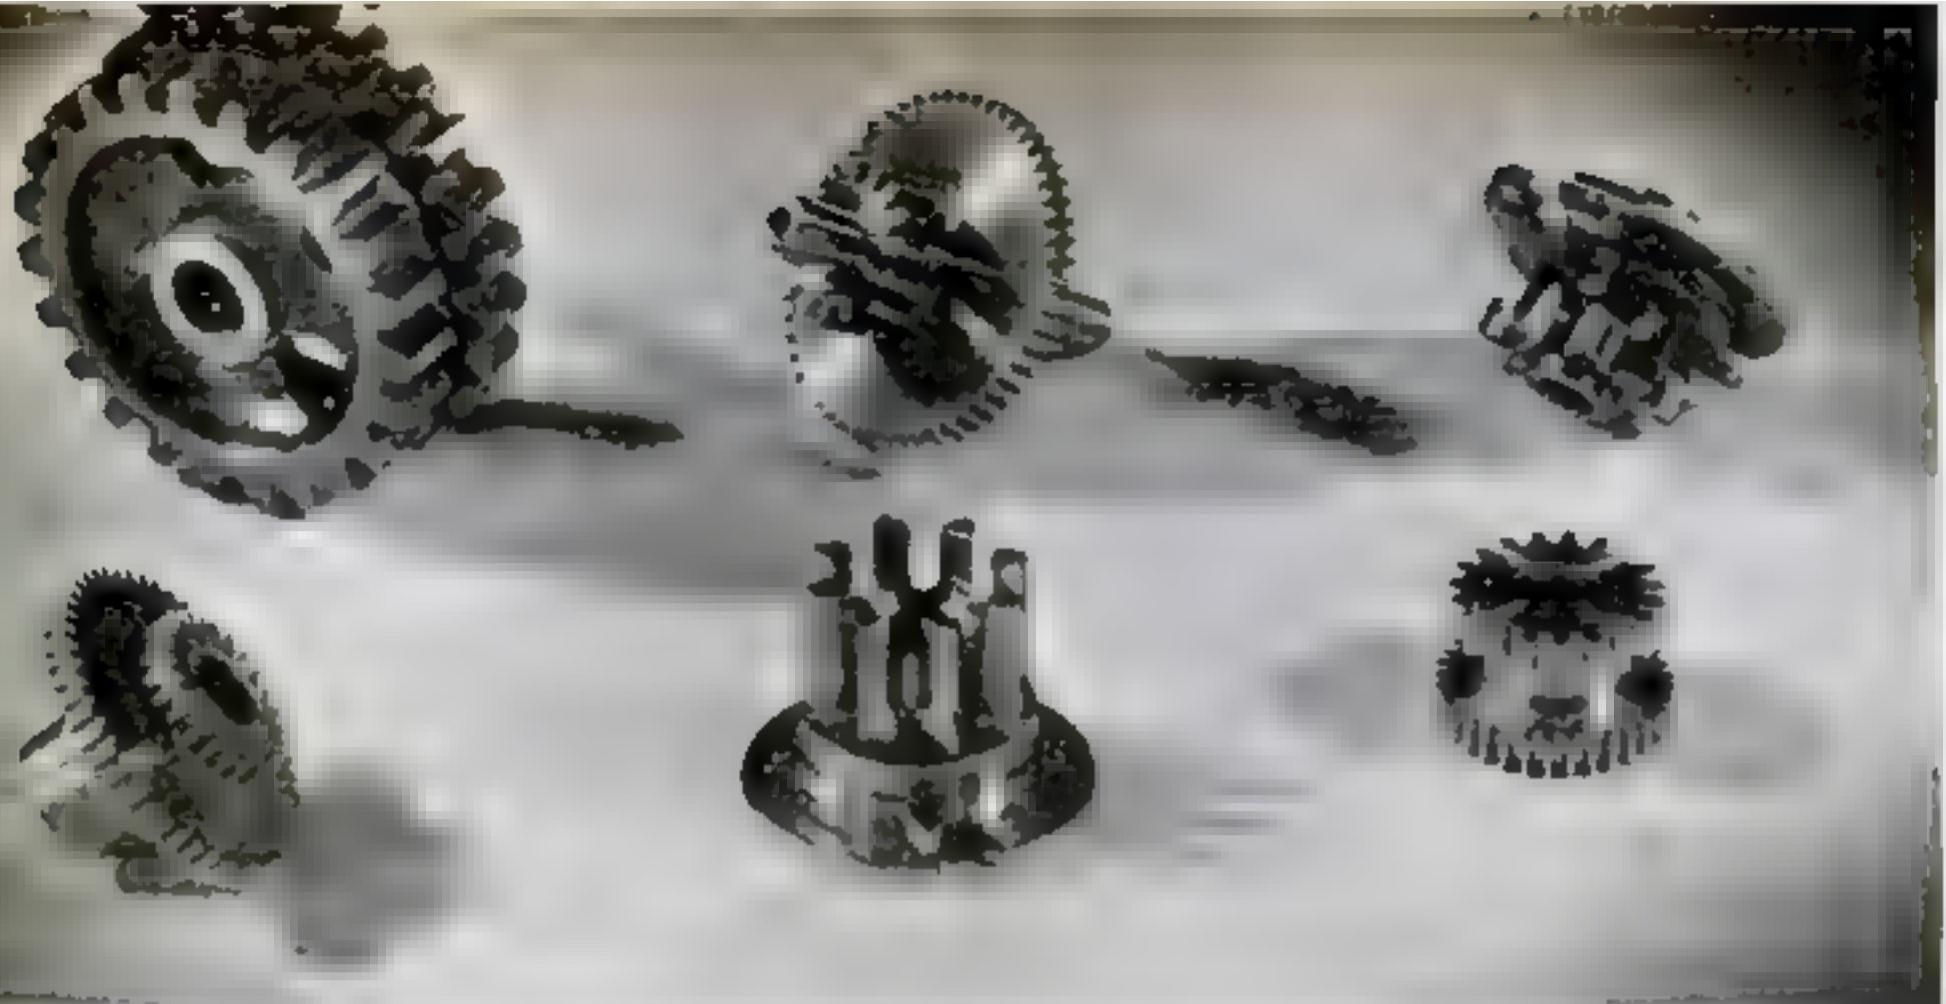

WORM CUTTER. Here the thread of a worm gear is being shaped. The gear-like cutter bites into the cylindrical blank while both are rotated, producing the screwlike thread that characterizes the worm gear

GLEASON machine cuts straight bevel gears by the reciprocating action of little cutters resembling safety-razor blades. In the picture below, these are seen immediately below the end of the oil nozzle

FINISHING of gears cut on a hobber or shaper is done in this shaving machine. The teeth of the cutter (the large wheel) usually are set in a helix to the workpiece in order to assist the cutting or shaving action

MORE CLUSTER GEARS (see page 120). These six examples show how various kinds of teeth can be cut in a single piece of metal. Some have teeth of odd design to meet special requirements. Cluster gears simplify assembly and make it possible to obtain many different speeds from a compact gearing unit.

even cut fudge into uniform pieces by hand. Scores of persons with comparatively little training have operated these machines in war plants. And batteries of these modern cutting machines have enabled the Sperry Gyroscope Co., the Ford Motor Co., and

other firms to turn out tremendous quantities of fine-pitch gears for precision instruments.

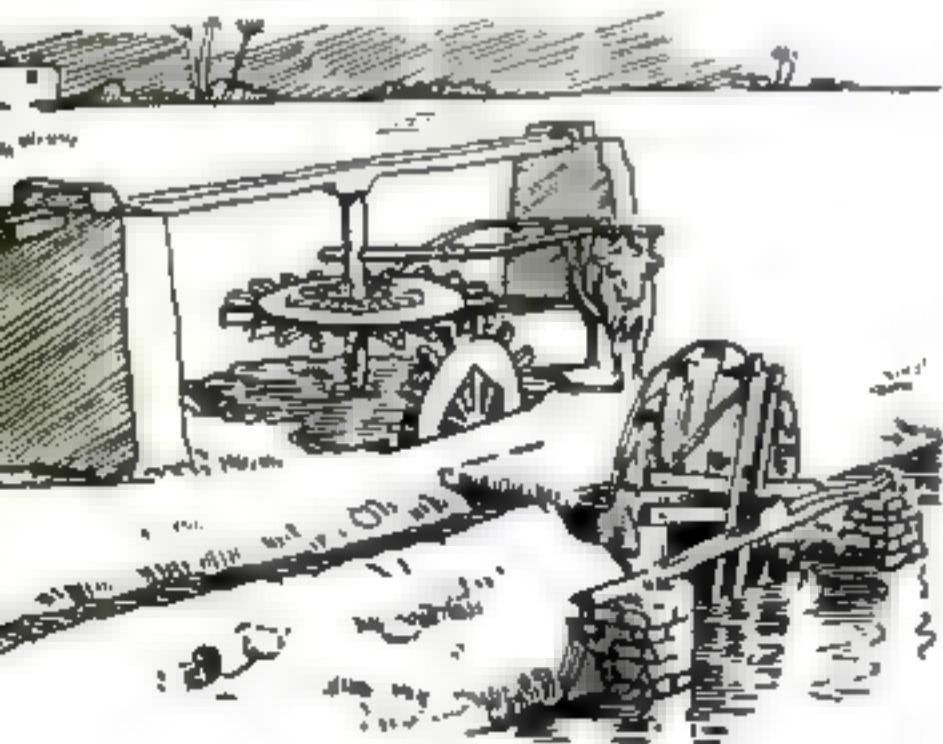

Among the fine-pitch gears in mass production there are many different types, such as spur, helical, bevel, and worm gears, and combinations of various types. Spur gears are those with teeth cut parallel to the axis. These gears are used to connect parallel shafts. Helical gears are those with spiral or curving teeth rather than straight teeth. This is a means of facilitating contact between teeth when two gears are rolled together, thus assuring smoother operation. The teeth of a spur gear may be either straight or helical. The teeth of a bevel gear, which is one with teeth placed at an angle to the axis of the wheel, may be either straight or spiral. Worm gears have teeth like the thread of a screw. Bevel and worm gears are used to transmit motion between shafts that are not parallel.

The blank disks from which these gears are made are turned out by engine lathes, turret lathes, and screw machines. One of these machines may automatically drill a hole in a stainless-steel rod, trim it the proper amount, and cut off the kind of wheel that is needed to make a gear. Without pausing, the machine may then pull the rod forward and proceed to turn out another blank wheel. Cams and gears govern the operations of the blank-cutting machines. Other cams and gears, in other automatic machines, then direct the cutting of teeth in these blanks. Thus gears are used to manufacture gears.

One method of cutting gear teeth in a blank is hobbing. A hob has a series of

THE EGYPTIANS INVENTED GEARS

LIFTING water from a well or stream was probably the first job ever performed by gears. The Egyptians had a source of power in the form of oxen, but the beasts walked in a horizontal plane while the water had to be lifted vertically. The problem, therefore, was to transmit power from a vertical shaft to a horizontal one. Pharaoh's subjects solved it by putting wooden pegs in the rims of crude wheels and mounting them at right angles to each other as shown in the sketch below. Buckets on the rim of a third wheel picked up the water and dumped it into an irrigation ditch or tank as desired.

blades in the form of a worm, and is revolved alongside the blank. The blank is rotated simultaneously so that the teeth cut in it by the hob will have the desired curvature. The relative speeds of the hob and the blank that is being cut are determined by gearing; other gearing controls the pressure of the hob against the blank. And, by changing this gearing within the hobbing machine, the same machine can be used to produce a considerable variety of gears.

Another method of making a gear out of a blank disk is the Fellows shaping process. A Fellows machine produces gear teeth by planing action. The cutter has teeth resembling those desired in the blank. As the cutter and the blank rotate at controlled speeds, the cutter hews notches out of the blank, and thus forms teeth of the proper size and shape.

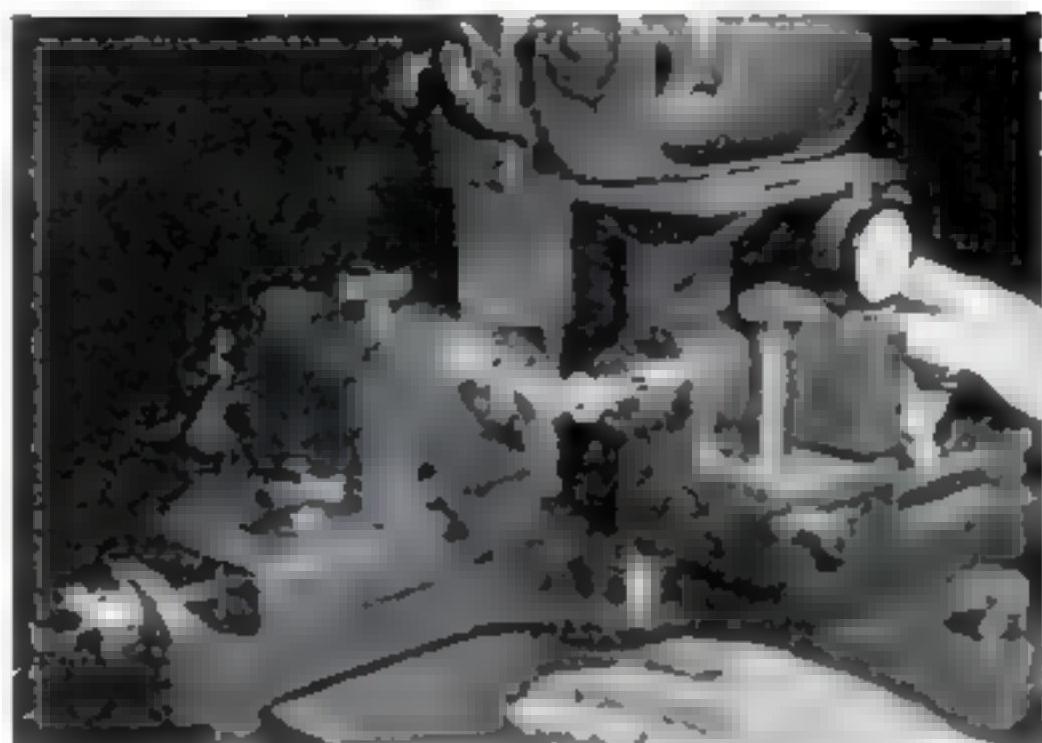

Cluster gears can be made with this machine. A cluster gear is really several gears made from a single piece of metal. There may be from two to a dozen different sets of teeth around its rim and sides. Using the same solid piece of metal for several gears simplifies assembling work, and saves precious space in compact, complex mechanisms.

A third way of cutting gears is the Gleason method, and it is used for carving bevel teeth. Straight bevel teeth are cut in a blank in the Gleason machine by the reciprocating action of little blades that look like safety-razor blades sliding to and fro. A cutterhead rolls these blades against the blank until each tooth is formed. Spiral bevel gears are cut by a rotating circular cutter, which is rolled against the blank similarly.

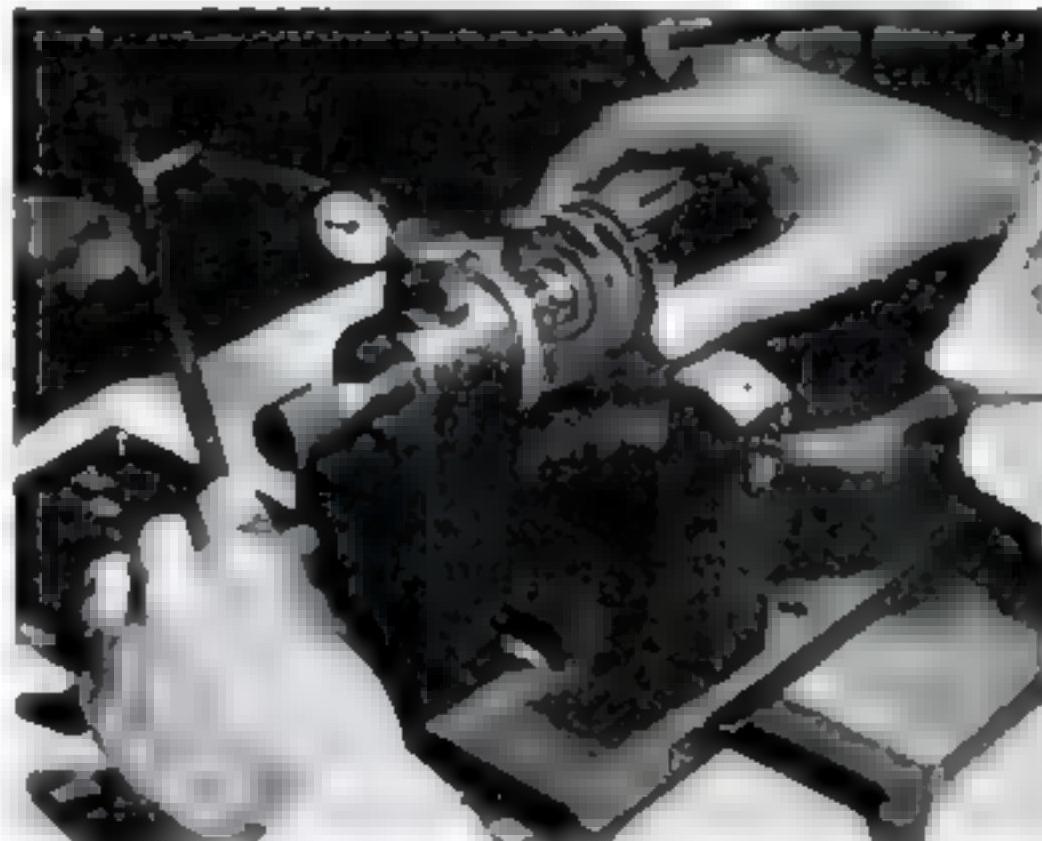

A finishing process follows the hobbing or shaping of the teeth of precision gears. This is done to eliminate small errors in the shape or spacing of the teeth. It may be done—automatically, of course—by rolling the unfinished gear against a rotary shaving cutter. Another finishing operation is burnishing. This does not correct inherent errors, but removes projections and burrs and improves the finish.

Obviously, a gear would be cut badly if a blank slipped while being spun in (*Continued on page 207*)

TESTING HIGH-PRECISION GEARS

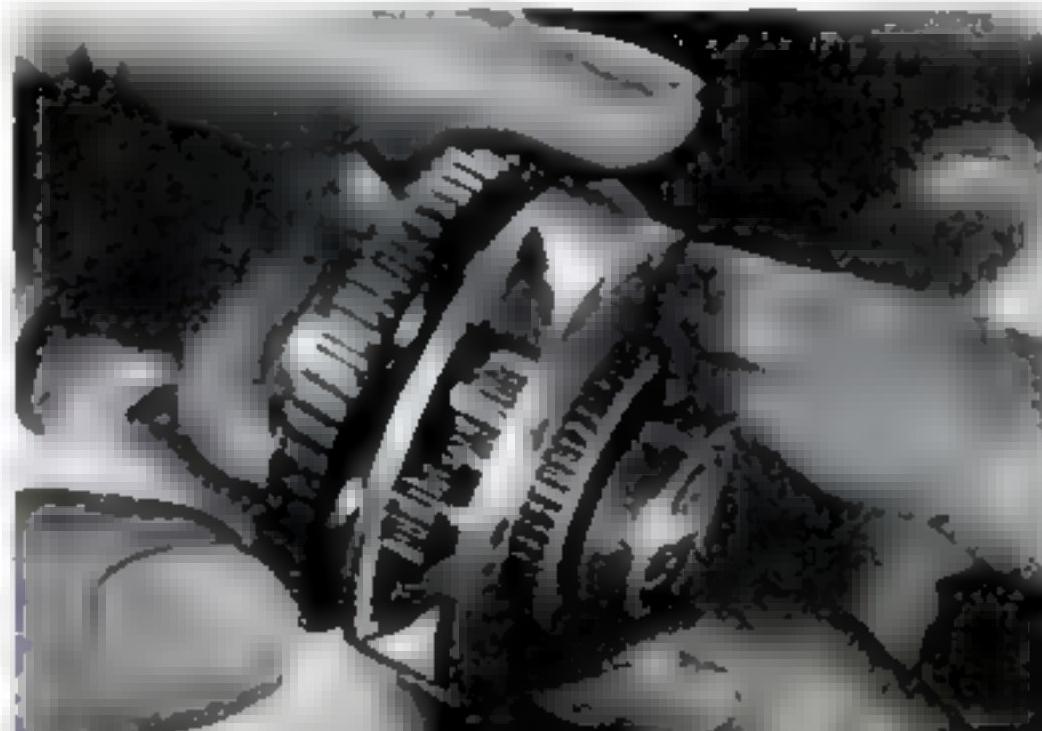

A testing machine at the Sperry Gyroscope Company's plant runs bevel gears together to determine accuracy of size and smoothness of running. Gears just off the cutting machines are run with master gears to show up possible imperfections

This sensitive apparatus detects wobble in the gears of a tiny differential containing eight fine-pitch gears. Still another test measures the backlash, or play, in the assembly

Here is the differential seen under test above. Seven teeth of the gears used in Sperry instruments are less than an inch in pitch diameter. They may have from 10 to 400 teeth

Nineteen U. S. Inventions That Changed the World

PART
II

The whole civilized world is now dependent on the American inventions described in this series by Miles Henninger, a patent lawyer of Milwaukee, Wis. His previous installment covered the grain harvester, cotton gin, sewing machine, steamboat, airplane, air brake, oil cracking, and rubber vulcanizing. Now he presents 11 more pivotal discoveries, the greater part of which are concerned with communication, either of the voice, as with the telephone, vacuum tube, and phonograph; or of ideas, as with the telegraph, typewriter, linotype, and motion-picture projector.

Morse offered his invention to the United States, British, and French governments, with no takers. Then the sending and receiving keys were developed, handling 20 to 30 words per minute. In 1843, Congress granted Morse funds for a trial, and a line was laid for 10 miles in lead pipe, with a conductor wrapped in cloth soaked with beeswax and tar. This was a failure. The line was then mounted on poles, with door-knobs as insulators, and was successful. Morse again offered his invention to the U. S. Government for \$100,000. He was turned down, but private capital backed the telegraph, and it stepped up communication not only across the American continent but across the seas. Morse became wealthy and received honors commensurate with his achievement.

S. F. B. MORSE was a successful portrait painter for 17 years before he visited Europe in 1829 and saw the electrical discoveries of that time. Inspired by these, he lived and worked in a single room for five years while he insulated wire, made electromagnets, and invented a relay to overcome voltage line drop. By 1838, he sent messages in a dot-dash code at the rate of 600 words per hour.

10 THE TELEPHONE 1876

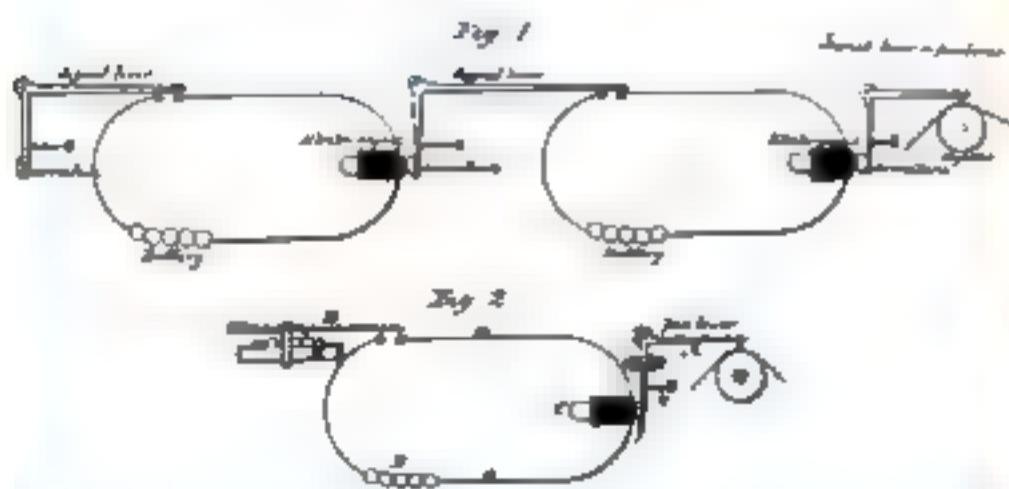

ALEXANDER GRAHAM BELL, of Scotch birth, became a teacher in the Boston School for the Deaf. There he worked with devices for producing and recording sound waves, and conceived the idea of controlling an electric circuit by sound. His efforts resulted in the telephone, in which sound vibrations act on a diaphragm to make and break an electric circuit, actuating another diaphragm to produce sound at a distance. In the beginning, the Bell invention was ig-

11

nored; at first it was used only as a burglar and fire alarm. By August 1877, there were 778 telephones in use, but at this time the Bell Telephone Association was in financial difficulties, and offered the invention to Western Union, which did not accept. Later the inventor won litigation with the telegraph company, and Bell stock went up to \$1,000 a share. The American Telephone and Telegraph Co. was formed in 1886 to include the Bell interests, and the inventor realized a comfortable fortune.

11. THE VACUUM TUBE (1908)

LEE DE FOREST was a minister's son with a large capacity for getting into trouble. He had difficulties of various kinds getting through schools including Yale's Sloane Laboratories. After graduation, he worked at the Western Electric Co., where he

saw the iron filings coherer that interrupted the circuit after each signal. This determined De Forest to develop a signal detector with a continuous circuit, but work on it caused him to be fired from several jobs. When he finally placed a third electrode in Fleming's diode tube, he opened the way for the entire electronics industry of the present time.

12. THE TYPEWRITER 1868

C. L. SHOLES a printer, invented a numbering machine. A friend, Carlos Glidden, said, "If you can write numbers, why not letters?" So, aided by a machinist named S. W. Soule, Sholes started to work. After five years of labor, he produced typewriters that met the objections to former devices, but the machines were not durable, and they cost \$250 each. Suitable improvements in design and quality were made, after which 400 machines were sold the first year. From then on, the typewriter was a success.

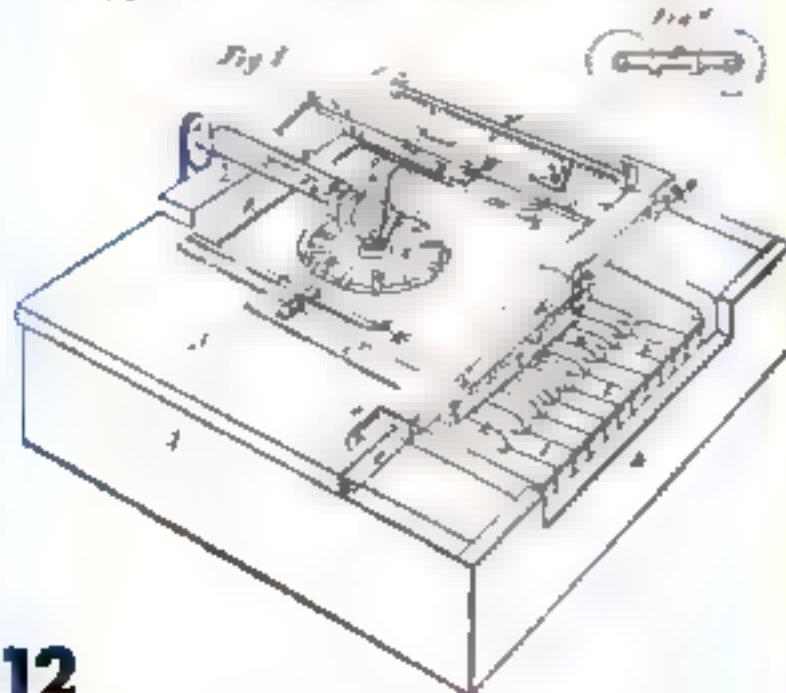

13. THE LINOTYPE 1869

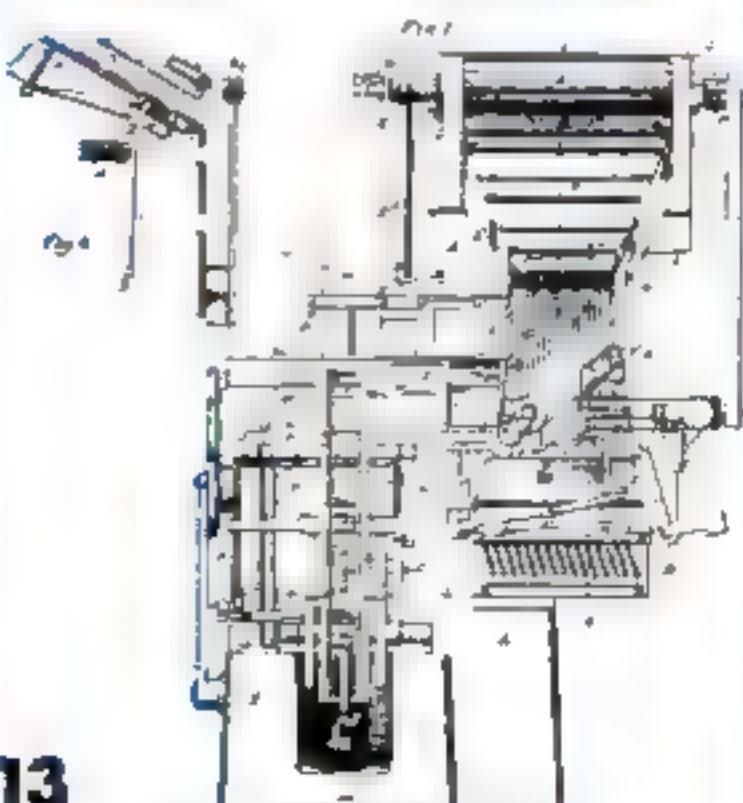

O. MERGENTHALER, an immigrant machinist from Germany, began in his cousin's shop in Washington. Here he worked on unsuccessful machines for typing Senate reports on paper strips for lithographing, and for embossing paper strips used in casting metal. This led to the invention of the first typesetting machine, named the Linotype, because it cast a line of type in one slug with matrices positioned from a keyboard.

O. MERGENTHALER
MADE BY THE MERGENTHALER BROTHERS TYPE MANUFACTURERS
No. 420 532 Patented Sept. 18, 1869

14. THE PHONOGRAPH 1878

THOMAS A. EDISON invented the first practical device for recording and reproducing sound. While working to improve telephone transmitters and receivers, he learned the power of sound waves, and he discovered that the telegraph repeater, using an embossed paper disk on a turntable, gave off a musical note. On this basis he built a machine, after many trials, that used tin foil as the recording surface. When he demonstrated it in Boston, the public paid \$1,800 in one week to see and hear it.

15. INCANDESCENT LAMP 1880

ANOTHER EDISON TRIUMPH followed a few years after the phonograph. There had been other attempts to produce a durable and effective incandescent-filament lamp, notably that of Sawyer and Mann with its carbon filament 1/32 inch in diameter. This, however, used large currents, produced only feeble light, and soon burned out. Edison succeeded in making and mounting a carbon filament 1/64 inch in diameter. This doubled the filament surface and quadrupled resistance so that a small current at relatively high voltage could be used. Having already developed 110-volt dynamos, Edison now devised sockets and fixtures, and organized separate companies for manufacturing the different parts. A new era in lighting had begun, and Edison shared in the returns.

16. MOVIE PROJECTOR 1893

EDISON FAILED TO CASH IN with his invention of the motion-picture projector because it appeared too soon. Others had projected pictures at rates varying from 12 to 32 per second to take advantage of the well-known optical phenomenon called persistence of vision. Edison determined that the correct speed for optical continuity in the projected pictures was 16 frames per second. Then he developed a film drive and shutter mechanism to attain that speed, together with a means for shielding the film from the heat of the lamp, and a proper lens system for focusing the pictures on the screen. At the time of the invention, there was no serious attempt to introduce it to the public.

17. ALUMINUM 1889

CHARLES M. HALL was a minister's son. As a boy he read about aluminum in his father's books. He studied chemistry at Oberlin College, where his interest in aluminum was reawakened by seeing the metal produced by a known chemical method at a cost of \$8 per pound. After graduation, he conceived the idea that fused aluminum ore could be electrolytically separated. Then he discovered that molten cryolite would dissolve bauxite, and he put his theory to a test that proved successful.

18. INDUCTION MOTOR 1888

NIKOLA TESLA, a Croatian-born electrical engineer, came to this country in 1884 as a dynamo designer. At that time there were no practical small A.C. motors, and individual machines in factories were powered from shafting and belts. Tesla solved the problem of consequent waste of energy by inventing the induction motor, which made unit drives for machines feasible. The motor had a rotating magnetic field that eliminated the need for a commutator and brushes. Westinghouse bought the patent rights to the invention, one of 700 credited to Tesla.

19. "BAKELITE" 1909

LEO H. BAEKELAND taught chemistry and physics at the University of Ghent, Belgium, until he came to the United States in 1889. He invented Velox, a photographic paper, and when its manufacture became a going business, he sold it to the Eastman Kodak Co. He then turned to work in synthetic resins. After 12 years, he found that phenol and formaldehyde, when heated under pressure, produced an amber transparent material that molded perfectly. The name "Bakelite" honors the inventor.

How Good a Weather Prophet Are You?

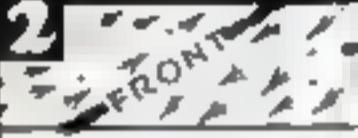

Put a check mark beside the statements you think are true, a cross beside those you think are false. Then grade yourself.

1

The weather blanket that is spread over the surface of the earth is about 100 miles high.

2

A very high, solid cloud roof heralds a warm invading mass of air—a "warm front."

3

The altimeter does not measure height above land, but above sea level.

4

Ice forms fastest on the wings of an airplane inside billowy cumulus clouds.

5

In speaking of the cloud ceiling, aviators refer to the top of the cloud formation.

6

Warm-front rain lasts longest, while rain from a cold front is of shortest duration.

15

The correct scientific name for this "mare's-tail" formation is "stratus."

14

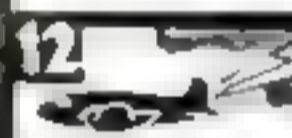

Hailstones originate inside of the cumulo-nimbus cloud formation.

13

The thunderhead has a vacuumlike core of still, rarefied air.

12

Lightning is a great menace to passengers in all-metal airplanes.

11

Rain usually falls in areas where the air pressure is highest.

8

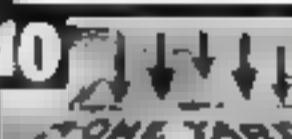

Winds near the earth's surface usually attain the greatest velocity.

9

Rain falls most readily from the clouds that hang low in the sky.

10

The atmospheric pressure on one square yard at sea level is about 10 tons.

TURN TO PAGE 207 FOR ANSWERS

I Ride "the Beast"

By Lt. Comdr. JOSEPH W. RUNYAN,
USNR

As told to ROBERT E. MARTIN

AT THE aft end of the carrier deck some of our Helldivers sat packed together, hunch-shouldered against the wind like cattle sharing the warmth of their collective bodies. Below, stored in the cavernous hangar deck, were other dive bombers, ready to be wheeled quickly on the elevators.

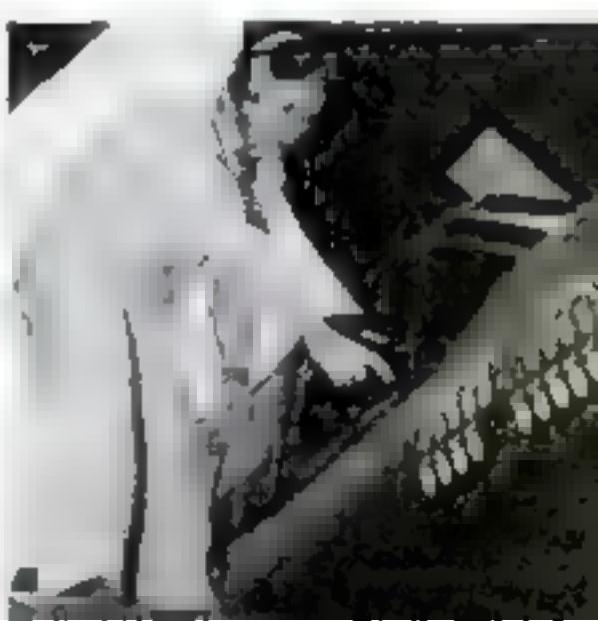

We knew that it wouldn't be long now. We were entering the combat area of the western Pacific, bound for what was to prove to be one of the strangest engagements of the war.

Everything belied it. Some of the pilots and air crewmen lolled in their quarters or in the ready room. Others monosyllabically played poker.

"Bombing One," as our squadron

Climb into a Helldiver's cockpit and share the thrills of one of the strangest battles of the war.

TWENTY-NINE BOMBS painted on the side of his Curtiss Helldiver stand for 29 combat strikes that Lieutenant Commander Runyan has made against the enemy in the Pacific. He flew more combat hours than any other member of his squadron. Why? Because every time his name was taken off the flight schedule he would slip back and put it on again. He has been dive-bombing eight years. The group of which his "Bombing One" was a part destroyed 205 enemy planes, damaged three carriers, sank four other warships and damaged three, sank 11 cargo ships and damaged 16, silenced 56 AA batteries, and messed up countless fuel and ammunition dumps, warehouses, and barracks. He is now on duty in the U.S.

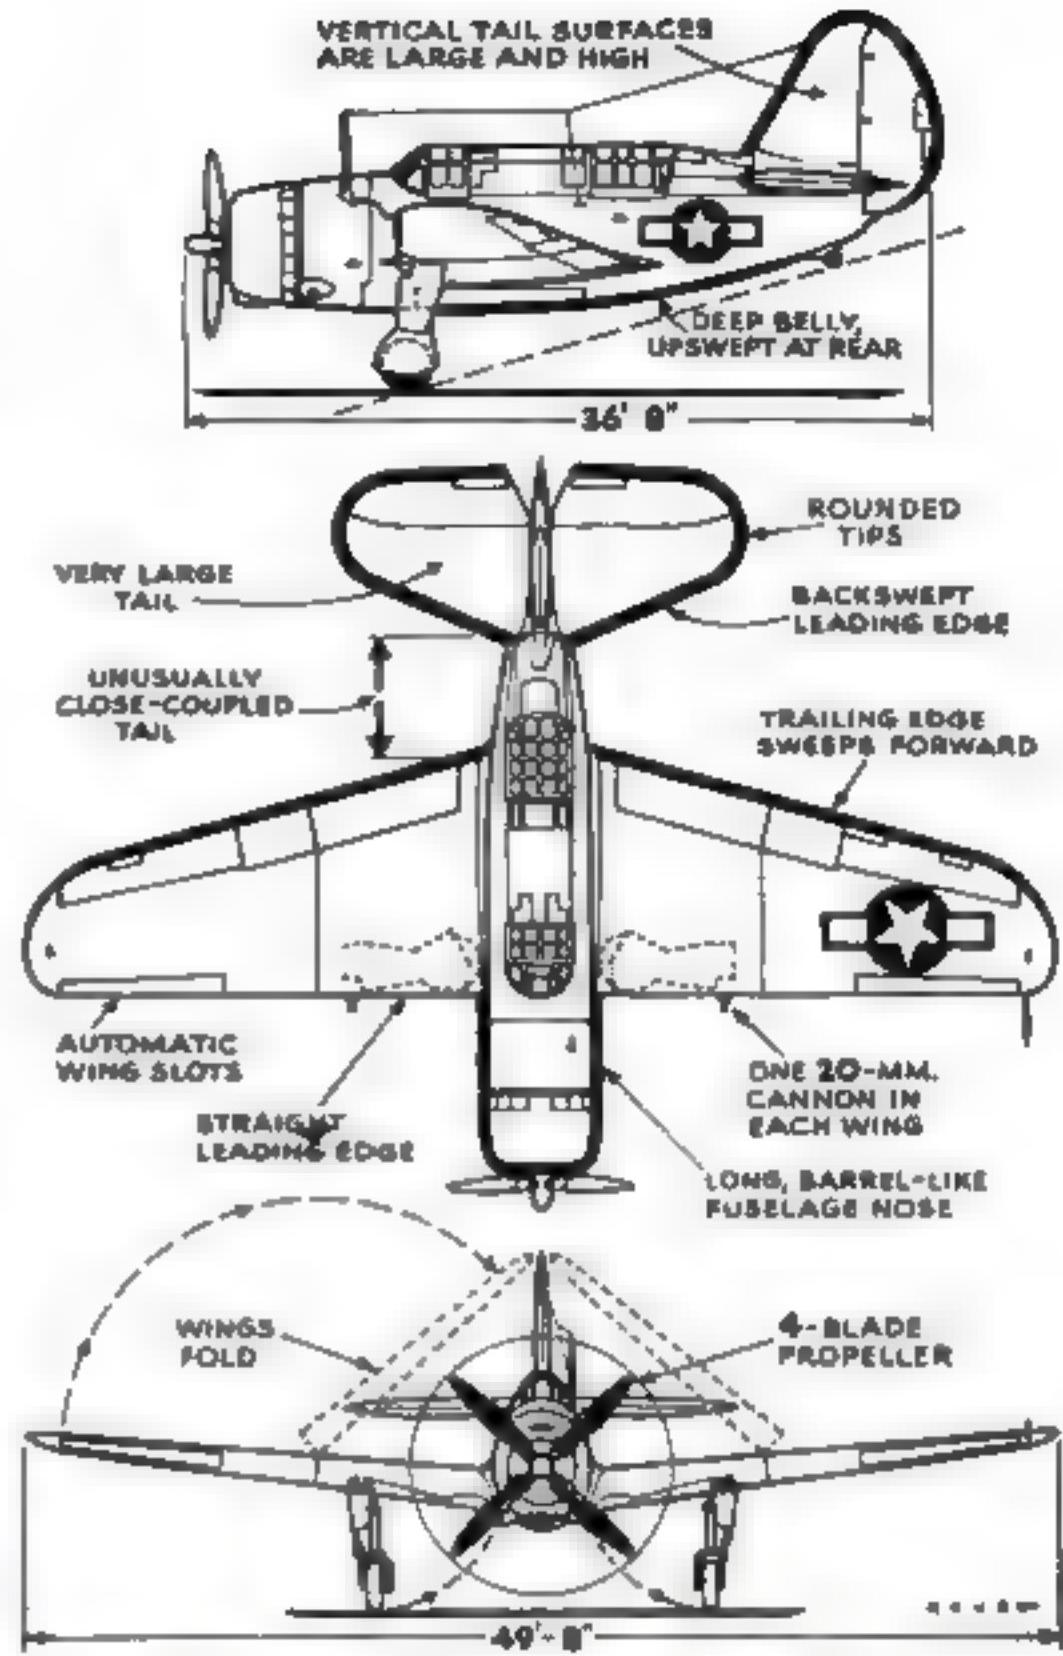

was called, had trained hard for this hour. We had new-type dive bombers, faster, more heavily armed than the carrier-borne bombers that had been thrown at the Japs in the critical battles in the Pacific earlier in the war.

Our Curtiss SB2C Helldivers, weighing some seven tons apiece, were built to withstand the strains of hard pull-outs and of bouncing deck landings when our carrier—which must remain unnamed—was pitching and rolling. It is one thing to put a plane down on an airport on solid land, and another thing to do it on a landing field that won't stand still.

These planes were "the beasts." Where the term came from I don't know, unless it derived from the big fuselage (wholly enclosing the bomb), the skyscraper fin, and the

OFF AND ON. A Helldiver zooms away from a U.S. Navy carrier while a sister plane lands and taxis to its berth after a dive-bombing and strafing blow at the Japs. At right, a returning plane is pushed toward an elevator that will lower it into the hanger. Note the outspread diving flaps on the upward-folded wings

HELLDIVER is easily identified by its squat, stubby look. Characteristic features are the straight leading edge and forward-sweeping trailing edge of the wing, the short distance between wing and oversize tail, and the deep belly

engine with its barrel-like cowling, which was as big as 10 wash tubs.

They had other attributes. They carried a 20-millimeter cannon in each wing, affording high firepower against enemy planes and ground installations. These were the first cannon ever fitted to an American dive bomber in the 16 years that the Navy had practiced the art. They also were the first to be mounted on a carrier-borne plane.

In addition to the 1,000-pound bomb carried in the belly, there were two 250-pounders under the wings. Protecting the pilot and rear gunner were 150 pounds of armor plate.

The Helldiver had been born in a cattle barn on the Ohio State Fair grounds at Columbus as the Curtiss company pushed its manufacture in temporary quarters while a new factory was being erected. The project director, Raymond C. Blaylock—who, by the way, had worked on the F8C, the original Helldiver, the first plane to be built specifically for dive bombing when the Navy was evolving the technique between 1927 and 1930—managed hundreds of modifications dictated by Pacific battle experience.

My squadron knew what its job was to be. The dive bomber and the torpedo plane constitute the Navy's one-two air punch. Their co-ordinated attack is the only type that has been evolved with weight enough to break (*Continued on page 205*)

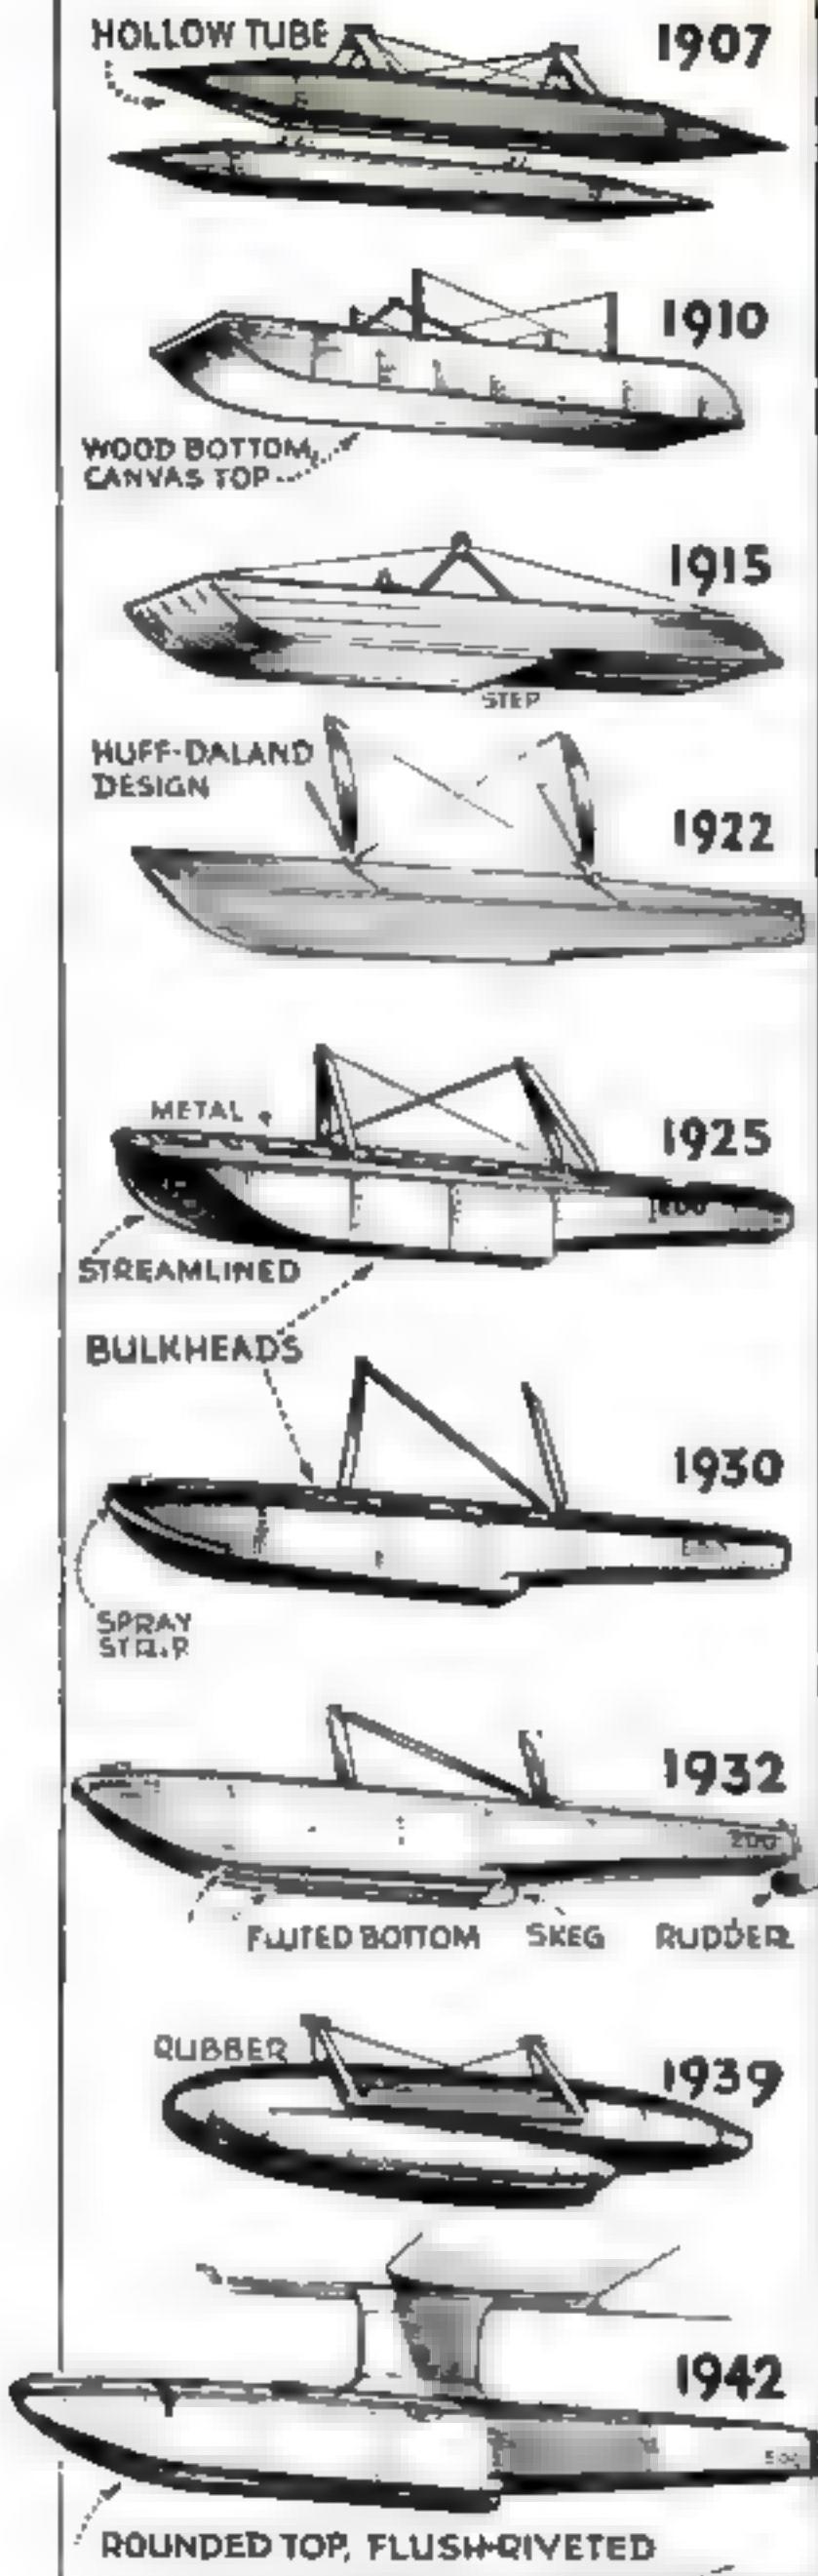

DIVING. An SB2C heads over in a dive. The opened wing flaps, or air brakes, are designed to slow the plane in its headlong descent and give the pilot better control.

THIRTEEN MEN (test pilots at the Columbus, Ohio, Curtiss-Wright plant) line up on the wings of a Helldiver to show its size. This, a later version than the one flown by Lieutenant Commander Runyan, has a four-bladed prop, more powerful engine

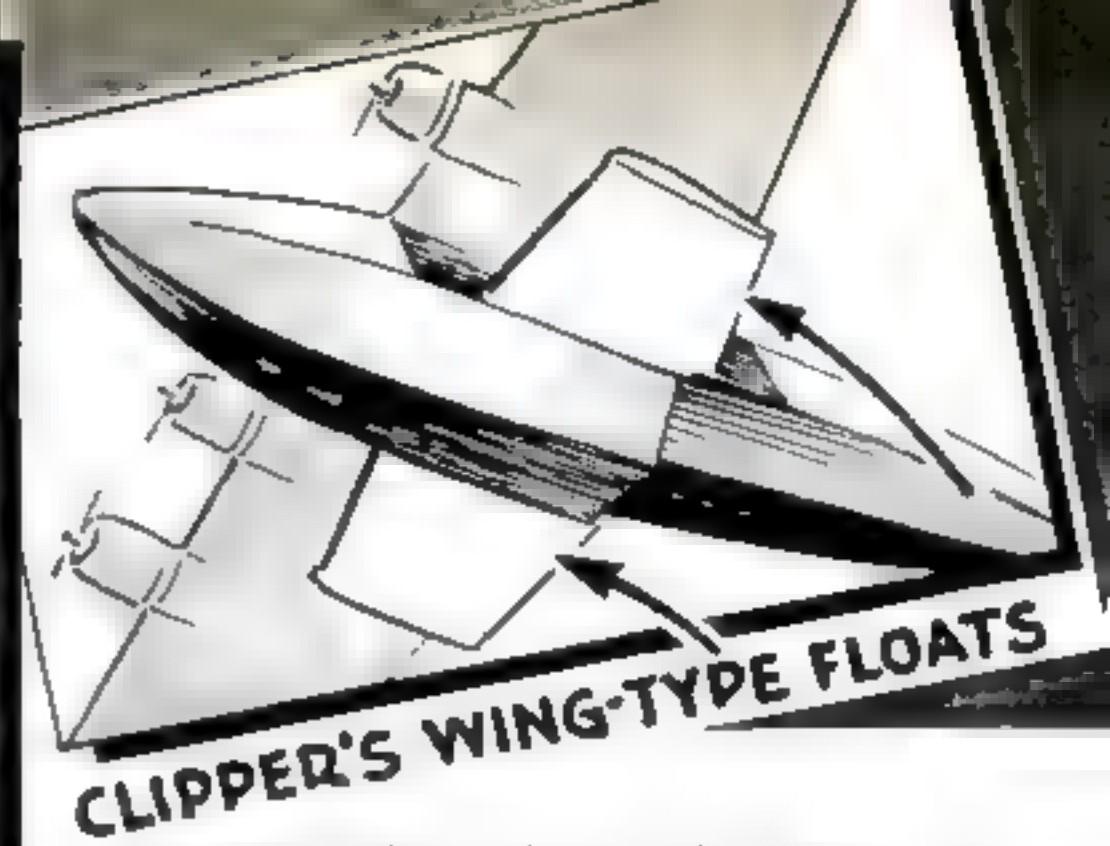

CONCEALED BOMB. First dive bomber to carry a bomb in its fuselage, the Helldiver packs a 1,000-pound package of destruction in its belly, two 250-pounders tucked under its wings.

FLOAT EVOLUTION over the past 30 years. In 1915 came the "step," which reduced suction and enabled ships to get into the air easier. 1932 model is used on private planes; '42 on commercial ships.

SPONSORS similar to those on the Clippers may one day become part of the seaplane. By adding lift, they help counteract their own drag.

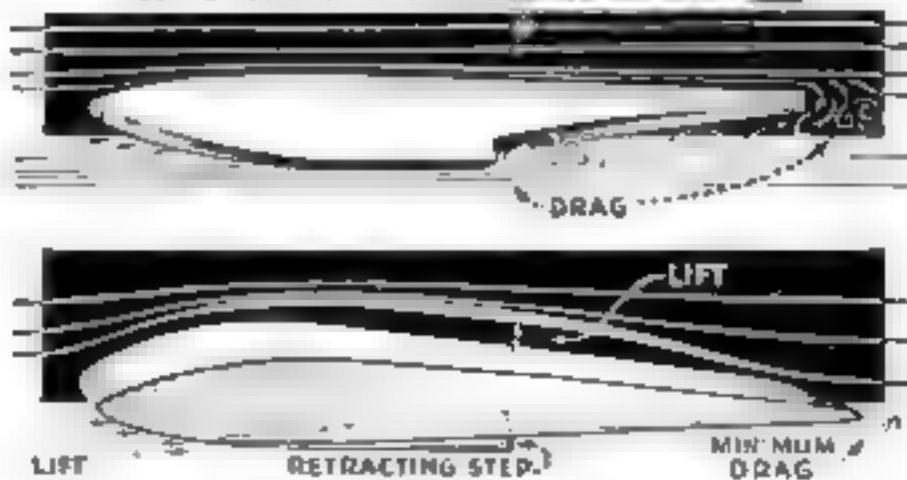

Will a Lake Be Your Postwar Landing Field?

Drawings by ERIC SLOANE

IN THE search for a safe, handy plane that will be popular with private owners in postwar years, the seaplane must not be overlooked. Operating from water, it has three quarters of the earth for a landing field and can take off in low-ceiling weather in which it would be both unsafe and illegal to fly a land plane. Terminal "runways" are already built, for nearly every important city lies near a sizable body of water. By merely fitting its floats with wheels, it can be made amphibious. Students also find that when they practice in the calm air and waters and unobstructed stretches of a harbor, flying is a lot safer and easier to learn than over the all-too-solid earth.

WING-SHAPED FLOAT. Instead of endeavoring to streamline away float drag, some observers suggest the float be built like a wing section, with a hinged step that can be retracted after take-off

TODAY'S FLOAT IS WELL STREAMLINED BY RETRACTING STEP

MARINE PORTS ARE OFTEN CLOSEST TO GREAT CITIES

UNLIMITED SPACE FOR A TAKE-OFF OR A LANDING

WATER IS ALWAYS LEVEL & SHOWS WIND DIRECTION

SEAPLANE FLYERS have the advantage of being able to find "runways" near almost every big city, of having a lot of elbow room on the surface, and of using direction of the waves as a "wind sock"

"LAND SKI"
EVEN WITHOUT WHEELS, A SEAPLANE IS AMPHIBIOUS

AIR OVER WATER IS LESS TURBULENT, WIND EVENER HOME STORAGE WITHOUT OWNING PRIVATE AIRPORT

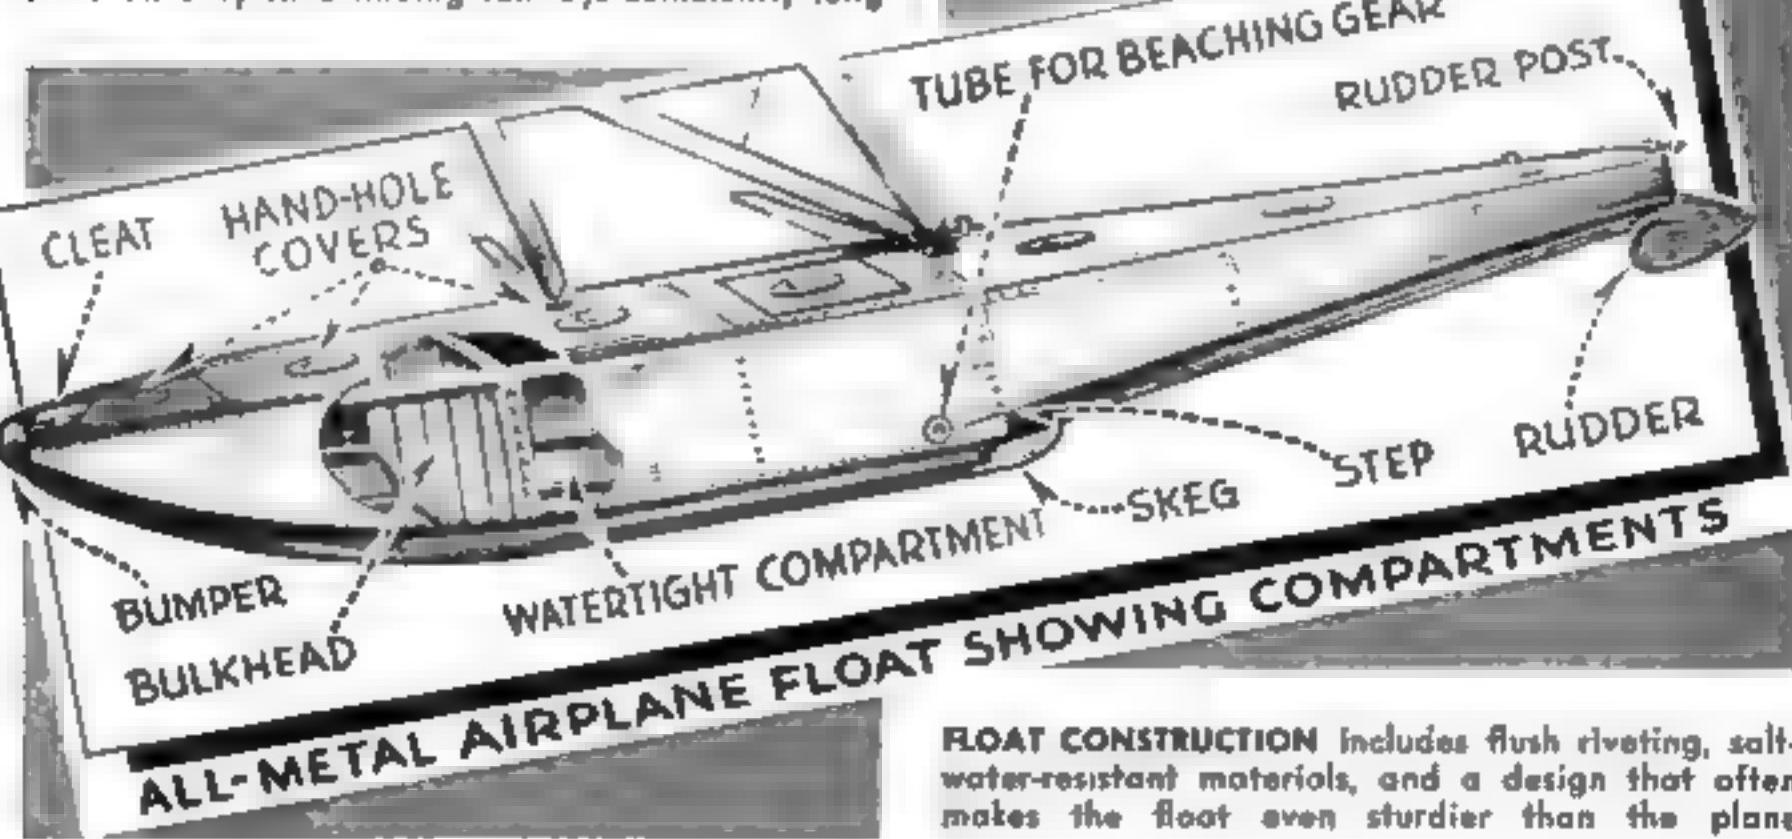

1931 RECORD WAS 406.997 M.P.H. ON PONTONS!
(LT STAINFORTH IN SUPERMARINE S.6B)

OTHER ADVANTAGES for the seaplaner are that he can alight on dry land if necessary, that over-water air usually is fairly calm, and that almost any near-by body of water will do as a landing field

1934 RECORD
(LFAGELLO IN 24 CYL.) 440.681 M.P.H.
MACCHI CASTOLDI

HIGH SPEED RECORDS have been made by seaplanes. Unlike fast land planes, swift seaplanes have an easy time finding runways sufficiently long

IN 1934 WHEN LANDPLANE RECORDS WERE JUST OVER 300 M.P.H., ITALY SENT THIS SHIP FASTER THAN TODAY'S FIGHTERS!

FLOAT CONSTRUCTION includes flush riveting, salt-water-resistant materials, and a design that often makes the float even sturdier than the plane

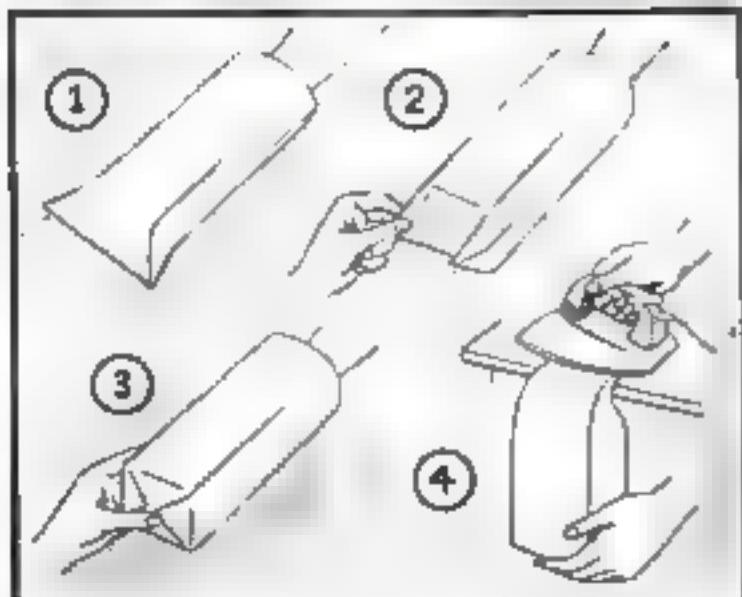

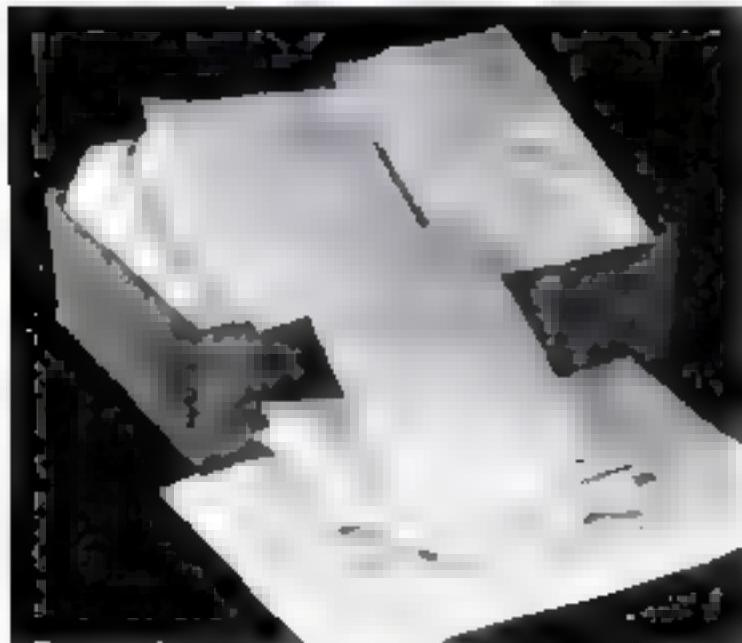

What's New in Modern Living

CHAIRS OF PLYWOOD are as comfortable to sit in as they are handsome and decorative. A single sheet of this versatile wood product is curved under special treatment to form a sturdy seat and back. It is set upon two sidepieces that serve as legs. The modern chair shown in the photo was put on display recently at an industrial designers' show in Detroit.

SYNTHETIC INSECT POWDER, packed in a container that also serves as a spray gun, has recently appeared on the market. The container is in two telescoped sections that are pumped to force out a cloud of powder. R. M. Hollingshead Corporation, of Camden, N. J., is the maker.

MOISTUREPROOF SACKS for sealing up dehydrated and frozen foods and for icebox storage of butter, cheese, meats, and the like are available at Lewis & Conger in New York. The containers are made of a lined, durable kraft paper. Food is put in carefully to avoid soiling the opening, which is then sealed up tight simply by pressing the edges with a hot electric iron.

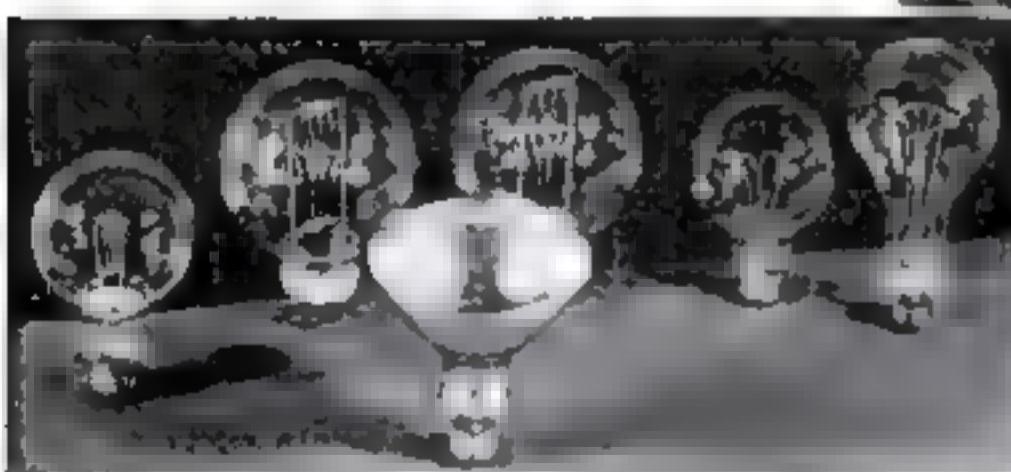

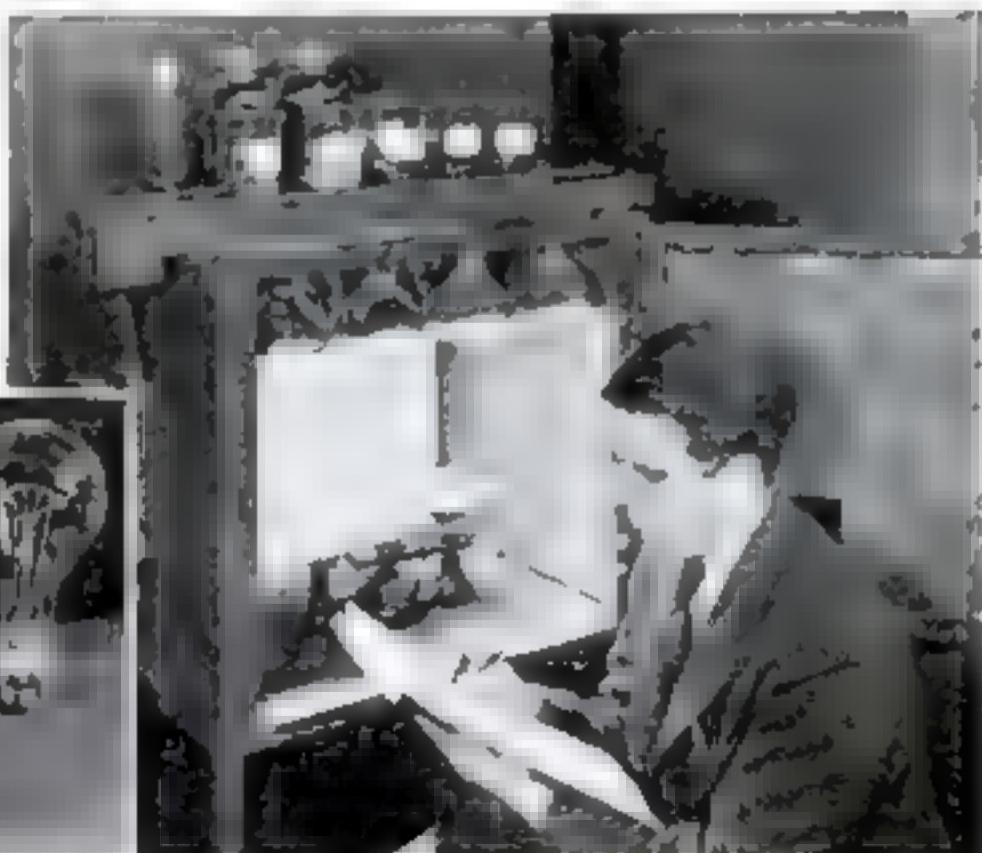

RECHARGEABLE FLASHLIGHT BATTERIES that are similar in principle to an automobile storage battery are now available for industrial users. They require a special 19-volt, .8-amp. Mazda lamp, available with a screw or flange base. This lamp has about twice the current draw of the type used with dry cells, but is said to give a distinctly brighter light. B. F. Goodrich Company, of Akron, Ohio, the maker, also reports that one wet cell will outlast 400 of the ordinary dry cells.

REDWOOD AND CERAMICS are being employed by California makers of toys and decorative figurines. The ornaments displayed at the right show the use of both wood and ceramics by Barnware, of Hollywood. No metal other than a few pins for joining was required in making the sturdy redwood pull toys shown below. The all-redwood rocking horse is made by Woodies from California, of Los Angeles.

LIGHTNING-FAST DEHYDRATION of food has been developed by a group of engineers at Vanderbilt University in Nashville, Tenn., using infrared lamps to cut the process from 20 hours to 20 minutes. A battery of General Electric lamps like those shown below are installed in the top of the oven. Speed is accomplished through a high rate of heat transfer. The food must be cut into small pieces to avoid scorching outer surfaces while water is being driven out. F. M. Tiller, who with E. E. Litkinhouse and Wilfred Turbeville, developed the process, is shown at the right with a test oven heated by the lamps.

Gus looked at the clipping. "Small used to stop by," he said.

By MARTIN BUNN

STATE Trooper Jerry Corcoran, his boots mirrorlike as usual, his sheepskin coat buttoned against winter winds, and his wide-brimmed hat at its habitual devil-may-care angle, regarded his friend Gus Wilson with the haggard eyes of a weary and worried man.

"What's the matter with you?" Gus demanded. "You look as gloomy as a funeral."

"I'm gloomy because I'm trying to prevent a funeral—and I'm not making such a hot job of it," Jerry answered. He took some papers from his pocket and passed one over. "Remember that?" he asked.

Gus looked at the newspaper clipping and nodded. "Poor Hank Small," he said. "Used to stop by when he had a taxi—before he started driving a truck for the Victory plant. Went to sleep and ran off the road."

"Broke his neck," Jerry agreed grimly. He handed Gus another clipping.

"I remember this one, too," Gus said. "Same kind of accident. I didn't know Sam Schwartz."

Jerry lit a cigarette. "Do you see anything queer about those two wrecks?"

Gus shook his head. "Why, no," he said, "unless it is that both drivers worked for the same concern and were killed in accidents of the same sort within a few weeks of each other. Hard luck runs in streaks."

"Yes," Jerry assented. "We figured it was just a hard-luck streak, too." He handed Gus a folded sheet of paper. "But not after about a week ago when every driver who works for the Victory outfit got one of these."

Gus unfolded the paper. It was a ruled sheet torn from a cheap pad, and on it was a single line of penciled printing that read:

IT WILL GET YOU TOO

Gus whistled softly.

Gus Beats

"We haven't any proof," Jerry said, "but we're pretty sure we know the guy who printed that. He's one of the drivers—calls himself William J. Smith. There's nothing against him except that before Pearl Harbor his name was something else and he belonged to the Bund. But last night they had another wreck of the same sort. Fortunately it wasn't fatal. You know Fred Gaskell?"

"He belongs to my bowling club," Gus said. "He's been working in the Victory plant ever since it opened, but he doesn't drive a truck. He's in charge of their fleet."

"Last night he drove one," Jerry told him. "Took the place of a fellow who lost his nerve when he found one of those warnings in his overall pocket. The Victory people have to make deliveries to a plant out of the State seven nights a week—they make parts for something the Army needs quick. That's why the G-men are interested."

"Gaskell wasn't badly hurt, and his truck was only partly wrecked," Jerry explained. "It's being towed here. We want you to go over it before anyone else does. O.K.?"

"Of course," Gus agreed. "I'll help if I can . . . Those other two accidents were investigated, weren't they?"

"Yes," Jerry said. "But Small was killed instantly, and Schwartz didn't regain consciousness, so neither could say anything."

Gus handed back the clippings and the penciled warning. "What was the date of the first wreck?" he asked.

"January 7th," Jerry told him. "The second was on the 29th." He wound his muffler around his neck. "You're lucky, working in a warm place. Believe me, riding a motorcycle last night was a cruel job . . . I'll escort the wrecker in."

Gus stared unseeingly at the shop door after it had closed behind Jerry. "It was cold last night," he said musingly. "It could be that . . . worth checking, anyway."

He went into the office and called Dr. Marvin. "Doc," he asked, "are you still playing with weather forecasting?"

Doc laughed. "I still keep an eye on it. Why?"

"Which night was the coldest so far this winter?" Gus asked.

"That's easy," Doc told him. "January 29th—five below zero at midnight."

"How about that night toward the beginning of the month?" Gus persisted.

Murder to the Punch

"It was cold then, too," Doc assented. "On January 7th it was one above—just a little colder than it was last night."

"Thanks," Gus said. "How cold is it going to get tonight?"

"I'll bet you a real good cigar," Doc said, "that it's below zero by midnight."

EARLY that afternoon Jerry Corcoran came into the Model Garage shop with a man who had one arm in a sling and his face decorated with bandages and surgical tape.

"Hard luck, Fred," Gus said consolingly. "It's nothing serious, I hope."

Gaskell grinned crookedly. "Nothing I won't get over. Lucky it wasn't my bowling arm."

"How did it happen?" Gus asked.

"According to all the evidence, I went to sleep at a curve," Gaskell admitted sheepishly. "It was so cold I had the windows closed, and I remember feeling drowsy and thinking that I ought to open one. The next thing I remember the truck was in a ditch."

"Truck outside?" Gus asked. "I'll look at it. Make yourself comfortable, Fred."

Gus examined the front end carefully. Then he got into the cab. After a minute he climbed out, raised the hood, and examined the engine briefly.

Back in the shop he faced Jerry and Gaskell. "I've found out how your trucks were wrecked," he said. "But that's only part of the job. We want to catch the man who murdered Small and Schwartz—catch him red-handed, and send him where he can't do any more damage. We can do that tonight, if you two will help."

"It's O.K. with me," Gaskell said.

"I'm taking your orders," Jerry assented.

"Good!" Gus said. "Now, Fred, when are your trucks serviced, and when do they leave on their night trip?"

"They're serviced in the afternoon," Gaskell told him, "and they leave as soon as they're loaded—about seven o'clock. The drivers don't try to keep together. There'll be six tonight."

"Good enough," Gus said. "Fix it so I

Jerry was out the other side of the cab. In a few quick strides he caught up with the fleeing man

can go over them for 10 minutes while no one else is in your garage."

One of the plant guards was waiting for Gus and Jerry when they came to a stop at the gate of the Victory Manufacturing Company. "I'll take you to the garage, Mr. Wilson," he reported.

"Thanks," Gus told him. He turned to Jerry. "Hook yourself onto Smith when he comes out, and when he changes trucks get in with him."

Jerry nodded. Gus followed the guard to the garage and left him at the door. He lifted the hood of each truck, examined the engine quickly, and made some notes.

The trucks were loaded in a courtyard. Gus swung his arms and stamped his feet through a frigid 10 minutes. Then Gaskell and Jerry appeared with a group of drivers who looked worried. "Get your trucks and load up," Gaskell told them.

They went off toward the garage. Jerry was following a short, thin, middle-aged man with a sullen face. "That's Smith," Gaskell pointed out. "He drives No. 4."

Gus consulted his notes. "After they all have backed to the loading platform," he ordered, "tell Smith to change to No. 2."

Gaskell nodded. He walked down the line as the trucks were backed to the platform and swiftly filled with heavy cases. "Smith!" he called. "Take Bill Henty's truck tonight . . . Henty! Drive Smith's."

Smith seemed about to protest, but he evidently thought better of it. He got out of his truck and into Henty's. Jerry climbed in at the opposite side. "You don't mind me riding a way with you, do you?" he asked.

The driver glowered, but he didn't protest. Then Gus climbed in at the left and crowded behind the wheel. "I'm going to drive awhile," he explained.

He drove out of the yard and down the highway. Both cab windows were open. Gus closed his. "Shut your window, Jerry," he said. "We don't want to catch cold."

"Better leave them part-way open," Smith growled. "It gets stuffy if you don't, and we're apt to get sleepy."

Gus laughed genially. "Why, man," he said, "it's close to zero and getting colder."

They drove on and on. Two hours passed. As they neared a roadside tavern, Smith broke his silence. "Stop for coffee," he demanded. "I've got to have a cup to keep me awake."

But Gus drove on. "You don't need to keep awake," he told him. "I'm driving."

They went on for another hour. Gus's head was aching, and Jerry's stomach wasn't feeling right. Smith, who had slumped forward in his seat, straightened up with an effort. "I gotta have air!" he muttered. "Open a window. Lemme outa here!"

"Small and Schwartz had to have air, too—but they didn't get it," Gus said sternly. "What's the matter—are you afraid?"

He felt the little man start. "Open a window, mister," Smith whined. "We'll all be dead if you don't. This cab's full of carbon monoxide!"

"Now you're imagining things," Gus told him. "Where would carbon monoxide come from?"

"The exhaust fumes are coming up through the floor boards," Smith gasped. "The exhaust manifold is loose."

"How do you know that?" Jerry asked.

"I know it because I loosened the nuts," Smith yelled. "Lemme outa here!"

The lids were dropping over Gus's eyes, and the road was weaving crazily in the beam of the headlights. He tried to open his window, but his fingers fumbled helplessly. Then there was a shattering of glass, and cold, fresh air rushed into the cab.

Gus gulped in lungfuls of it, stopped the truck, and swung out onto the running board. Jerry had his revolver in his hand—he had smashed the window with its butt.

Smith straightened up, and made a dive past Gus through the open door. Jerry was out of his side in a flash, his clubbed revolver still in his hand. He caught Smith in a few quick strides, and hauled him back.

THE next afternoon Trooper Jerry Corcoran came jauntily into Gus's shop. "A full, signed confession," he reported. "That Nazi is where he'll do no more harm. But say, how did you figure it out anyway?"

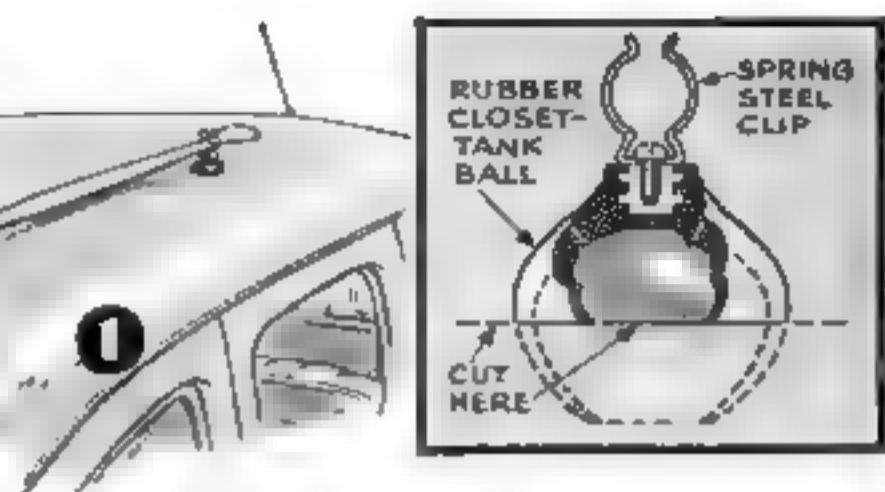

"You gave me the idea when you groused about how cold it was the night Gaskell had his wreck," Gus laughed. "When I checked, I found that Small and Schwartz had also run off the road on cold nights when they probably had their windows closed. That made it likely that something had put them to sleep or made them unconscious. Carbon monoxide was the only thing I could think of that would do it."

"When I examined the truck Gaskell ditched, I saw that some of the nuts on the exhaust manifold had been loosened with a wrench—there were fresh marks on them—and that the floor boards of the cab had obviously been loosened. Then when I checked the trucks at the Victory garage I found one had been tampered with."

"Making Smith ride in that truck with us," he went on, "seemed the surest way of getting a confession. But I didn't mean to run it so close."

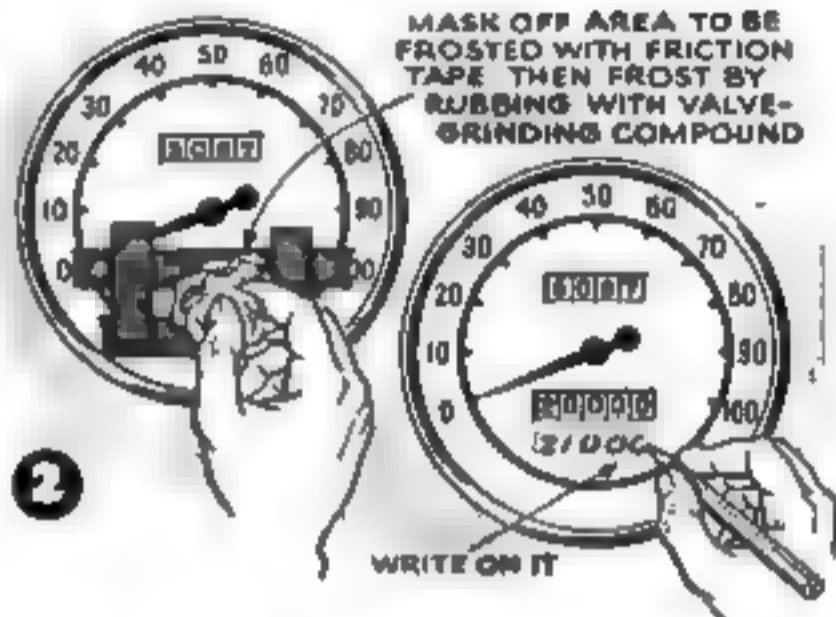

"I'll say you ran it close!" Jerry whistled. "But it was nice work, Gus. You ought to be on the force. There's a G-man big shot due in a few minutes to give you official thanks. You'd better put on a clean shirt!"

USEFUL AUTO HINTS

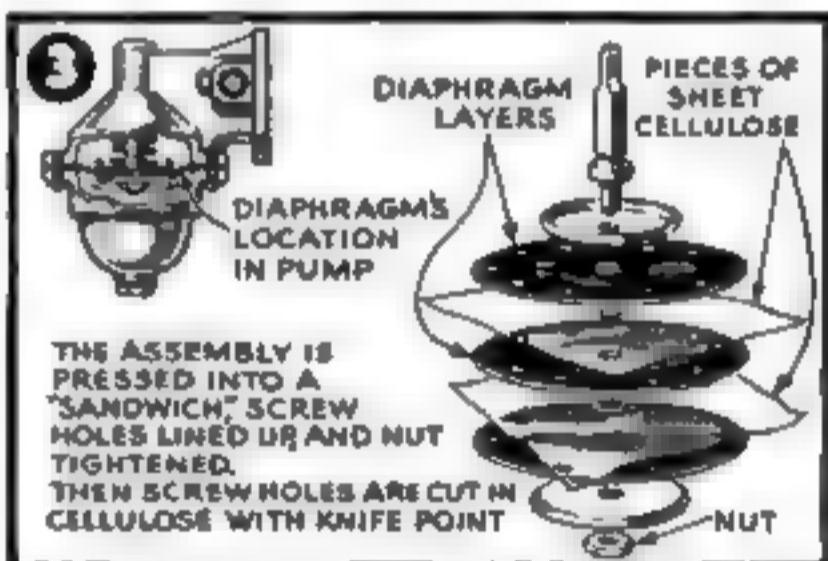

1 RUBBER VACUUM CUPS with strength enough to hold light articles on top of your car can be made from discarded flush balls that your plumber may be glad to save for you. There should be no puncture in the upper part. Cut off the balls about $\frac{1}{2}$ " below the halfway mark and face the edge on a rough emery wheel. Affix a spring clip to each threaded top.—J. E. W.

2 FOR A CONSTANT REMINDER of when to change oil or rotate tires, frost a strip on the speedometer glass to take pencilled memoranda, which can be erased or washed off when desired. One way to frost the glass is to mask an area with tape and rub with valve-grinding compound.—R. H. D.

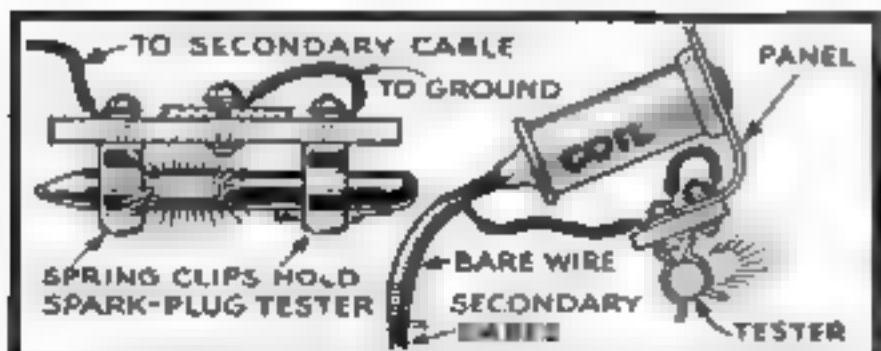

3 EMERGENCY REPAIR to a fuel-pump diaphragm is possible with the transparent cellulose wrappings from a candy bar, loaf of bread, or the like. Sandwich a sheet between each two adjoining diaphragm layers, trim the edges, and punch screw holes; then replace the assembly.—F. W. D.

4 CHECKING ON SPARK PLUGS is continuous with an electrically wired holder for a neon-type tester mounted within sight under the dashboard. Remove 12" of insulation from a length of wire, wrap it around the secondary cable, tape it over, and connect the other end of the wire to one holding clip. Ground the other terminal. Make the base of some insulating material. The tester will light by induction.—A. H. P

Drawings by STEWART ROUSE

Teach Your Car to

IF YOUR ENGINE BALKS AT THE COLD, THESE

By TOM McCAHILL

THERE is hardly a driver who doesn't know that he should change to light lubricants in bitter weather, and that he should watch the strength of his antifreeze. Most, too, make winter checks on the automatic choke and seasonal carburetor setting, if they have that equipment, and on thermostats and the generator regulator.

But there are some other less obvious points to watch if you would really have your car operate at peak efficiency during the cold months. For instance, most owners know that an engine becomes stiff in cold weather, making starting hard. They also know that a run-down battery can't furnish the current necessary to turn a starting motor quickly. But couple a stiff engine with a battery that isn't fully charged and you will let yourself in for some real headaches.

In turning a stiff engine, the battery carries a load far greater than normal. This overload deprives the high-tension circuit, which draws on the battery at the same time, of part of its required voltage, and as a consequence weakens the spark at the plugs. Then, too, the mixture from the carburetor will be cold and harder to ignite. In short, you may have a stiff engine, an overloaded, low battery, a weak spark, and a cold mixture. No wonder some cars are hard to start in winter!

These conditions can't be eliminated entirely in freezing temperatures, but they can be eased. If you have checked your generator regulator and have started the winter with a fully charged battery, you will have helped some. But also check the ignition system, including the points, spark plugs, and connections. A slight electrical leak that might pass unnoticed in warm, dry weather can cause starting trouble on a cold, damp day when condensation may provide a perfect ground.

Inspect the inside of the distributor cap and the high-tension wires for possible leaks or breaks if starting trouble develops. As an emergency measure in an extreme case where an abnormal amount of moisture is

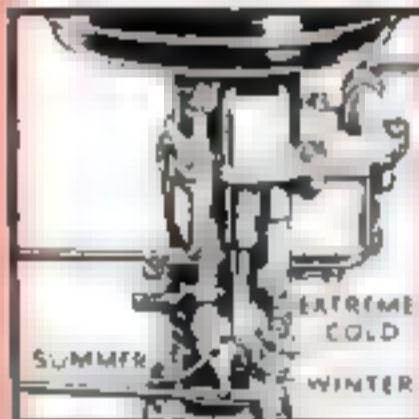

present from snow or a driving rain, you might try spraying the contents of a carbon-tetrachloride fire extinguisher over the electrical circuit from starting motor to spark plugs. The carbon tetrachloride will dry so quickly that it will absorb the moisture and you will be able to start the motor. But this is only an extreme measure and shouldn't be resorted to except in an emergency, for the chemical is rather hard on the wiring and on lubricated parts it may touch.

For a cold-weather starting stunt that may work on your car, try widening the

DO'S

Give your car a break and break the "cold seal" when the mercury is low. Before you try to start up, rock it in high gear with the switch off until the motor turns over. This saves the battery a terrific strain

Be sure that the seasonal settings are adjusted if your carburetor has them. If your car doesn't have this adjustment, set the carburetor manually for a somewhat richer mixture

Always step on the clutch before you press down the starter button, and you'll save your starter motor the heavy load of turning the transmission gears

Watch the indicator on the dashboard to see that your battery is receiving its proper charge. Check also on the generator regulator if the output seems too low

Laugh at Winter

POINTS MAY SAVE TIME, TROUBLE, AND TEMPER

spark gaps to present a longer flame to the cold mixture. Most factory-set gaps are .020" to .025", but you may find that you can widen yours a trifle for cold weather, even as much as another .010" to .015". Of course, you must have a fully charged battery or you won't have the voltage to back these gaps.

Incorrect handling of the throttle, such as opening it wide before the engine fires, can contribute to balky starting since it leans the mixture by increasing the air entering the carburetor. The only time to

open the throttle wide when starting is after the carburetor has flooded and the cylinders have been filled with raw gas. Opening the throttle then cleans out the raw gas after a few turns of the engine.

When a car has remained unused for some time in cold weather, the engine becomes very stiff, and what is known as "cold seal" often develops. The oil in the crankcase congeals and many parts of the engine tighten up. To avoid subjecting the battery to the terrific extra strain required to turn an engine in this condition, break the cold seal by rocking the car in high gear before starting the motor. Keep the switch turned off and rock the car back and forth until you feel the engine turn.

Condensation is always a danger to an engine in winter. You can't avoid condensation, for it is caused by heat inside the engine and cold outside, but you can lessen its bad effects by letting your engine warm up thoroughly every time you start it. Condensation may vary from a few drops to as much as a pint, depending on the contrast between heat and cold. If the engine isn't allowed to warm up thoroughly so this inside condensation will be carried off, water dripping from the interior walls will make its way into the crankcase oil, diluting it and creating sludge. Then this contaminated oil will be unable to provide the necessary protective film the next time the engine is run. Knowing this, you will be wise to avoid short runs, such as from the curb outside your house into your garage, and to walk to the drug store and the movies if they are just down the block.

A stunt that will speed the warming up of an engine is removal of the cooling fans in climates where the winter temperature rarely rises as high as 65 deg. Operation of the fans in freezing weather can keep radiator temperature as low as 140 deg., reducing the efficiency of an engine that for peak performance requires a radiator temperature of 160 to 180 deg. Remember, though, if you are using alcohol or some other antifreeze with a low boiling

DON'TS

Letting cracks and breaks in high-tension wires go without attention may rob your ignition system of needed voltage. Leaks may be caused by grounds that result from condensation, dampness, or driving snow

If you open your throttle wide before the engine has a chance to fire, the lean mixture will make starting hard. But if the carburetor floods with raw gasoline, then open the throttle wide

Bumps that hardly jolt you in mild weather can badly damage springs, axles, and frame if the metal is cold and brittle. Take it easy until your car loosens up

Never leave your car just outside the garage during a freeze. When you drive in later, the engine won't warm up sufficiently, and condensation will result

Properly firing spark plugs are a necessity when the mixture is cold. See that the gaps are set right, the points cleaned, and the porcelain sound

Your engine usually performs at its peak when its temperature is from 160 to 180 deg., but don't let it get too hot if your antifreeze boils easily

point, you run the risk of having it evaporate and leave you without antifreeze protection. You should also be sure that your cooling system is free from scale and rust and in top shape, or boiling will be a certainty and any gain in performance may be at the cost of some other serious trouble.

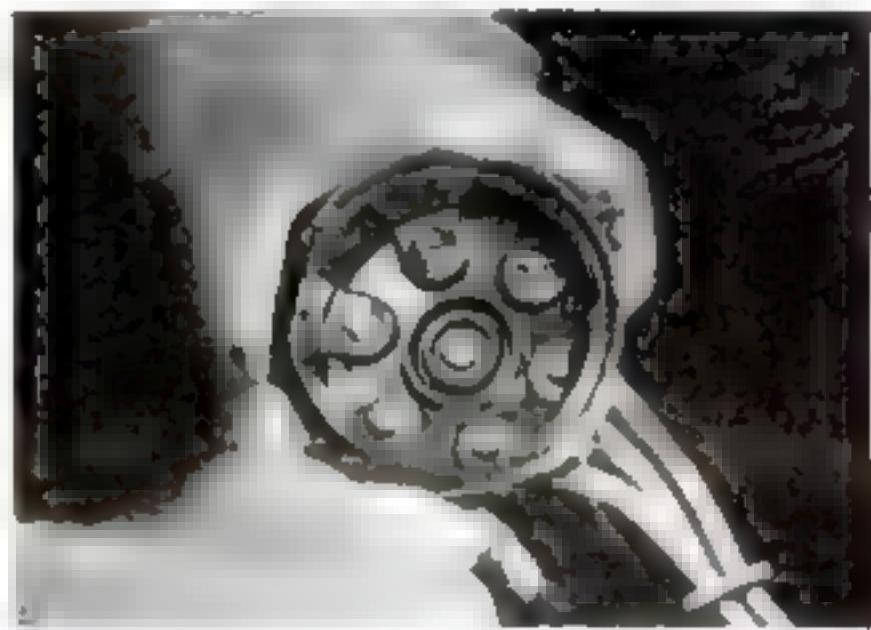

The fan blades are usually attached to the fan hub by four studs that can be easily removed or replaced when desired. Take them off if you decide to dispense with the fan in cold weather. Don't remove the fan belt, for in many cars this belt also turns the generator and the water pump.

Perhaps the least known of all winter hazards is condensation in the fuel pump. If the condensate freezes inside the pump housing and around the diaphragm, ice particles may prevent proper operation of the diaphragm with the result that the engine is deprived of its normal flow of gas and speed and power are reduced. In extreme cases the diaphragm may even be punctured by ice, causing a complete breakdown. Make sure that both the drain and the vent

Battery care is a "must" in cold weather. Check terminal connections, scrape off all corrosion, and be sure that the cells are kept well charged

If starting trouble develops, take a look at your distributor cap. A crack in it may result in a ground when condensation is bad in cold weather

holes are kept clear. This is the easiest way to prevent accumulation of condensation.

Many cars are equipped with heavy-duty rubber parts, such as engine supports and shackle fittings, and in cold weather the rubber tends to lose flexibility. You can keep these parts from becoming too brittle by spraying them occasionally with regular hydraulic-brake fluid. Don't spray rubber with oil, however, for oil causes most kinds of rubber to deteriorate.

The metal of springs, axles, and chassis also becomes stiff after exposure to cold and is unable to stand the ordinary bumps and jolts that it will take without bad effect in warm weather. That depression where your driveway joins the street should be eased over with respect when the temperature drops. If it isn't, you may wind up with several cracked leaves in your springs or with a fracture in an axle or even the frame. It is a wise precaution to take it easy when you start off on a cold day—let the running gear loosen up by driving at a moderate pace for the first mile or two.

THIS MIDGET THREE-WHEELER is the post-war-car idea of Robert H. Verkins, of Minneapolis, and his son, Wayne, now in the Army. It was designed and built entirely in Verkins' home workshop with the exception of wheels, headlights, and tires. Among its features are two 1-hp. engines with dual ignition and carburetion, bicycle-handlebar steering, upholstered spring seats, and a complete line of gadgets. It gets 65 miles to the gallon of gas and will do 32 m.p.h. The weight is 250 lb.

INCREASED VISIBILITY is given license plates by new-style numerals designed by Dr. Curt Berger, of Cornell University. Width of lines is decreased, and white numerals are put on a black background having a narrow white border.

DUAL WHEELS, which have long been made for truck rear axles, have now been developed for front axles as well. This application is made possible by a new design that gives each wheel of a pair independent operation. It will be ready for postwar buses, heavy trucks, and the like. The design can be accommodated both to demountable rims and to demountable wheels, and in both cases inflated tires can be removed and replaced.

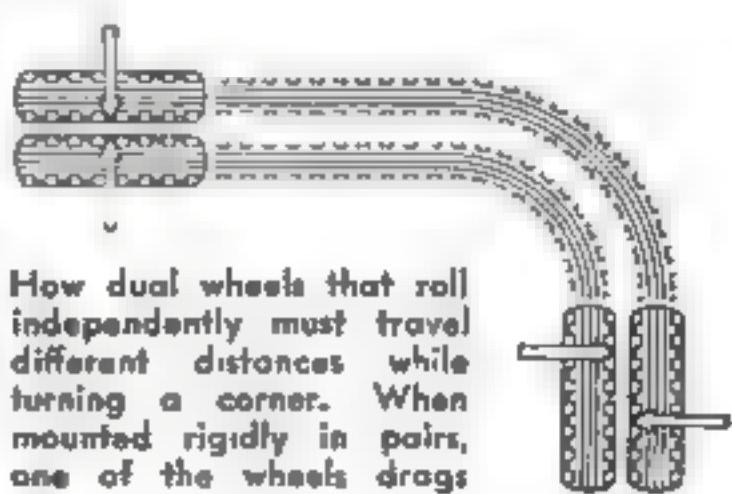

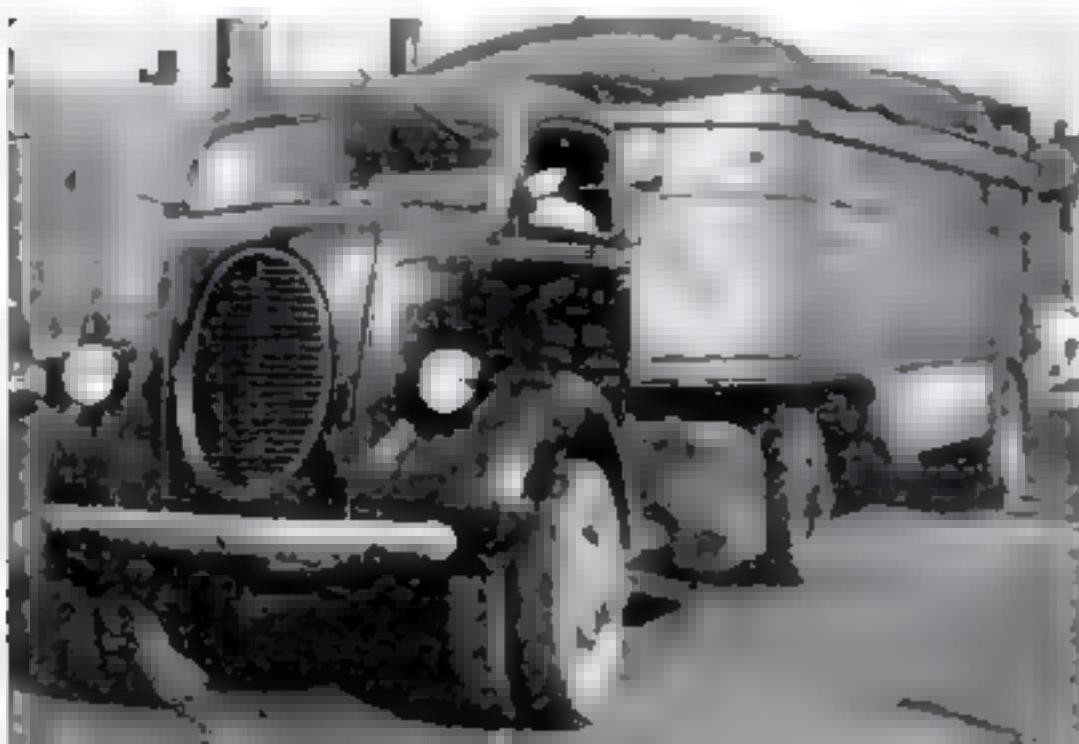

As indicated in the drawing, the unlocking of dual wheels so that the tires can roll independently is of particular importance in

AUTO Ideas

BATTERY SEPARATORS of thin "microporous" rubber have been developed for the armed services by the United States Rubber Company. Storage batteries containing them are initially charged; then the acid mixture is removed, plates and separators are dried, and batteries are shipped fully charged without acid and water, which are added again after delivery. A step in the manufacture of the separators is shown below.

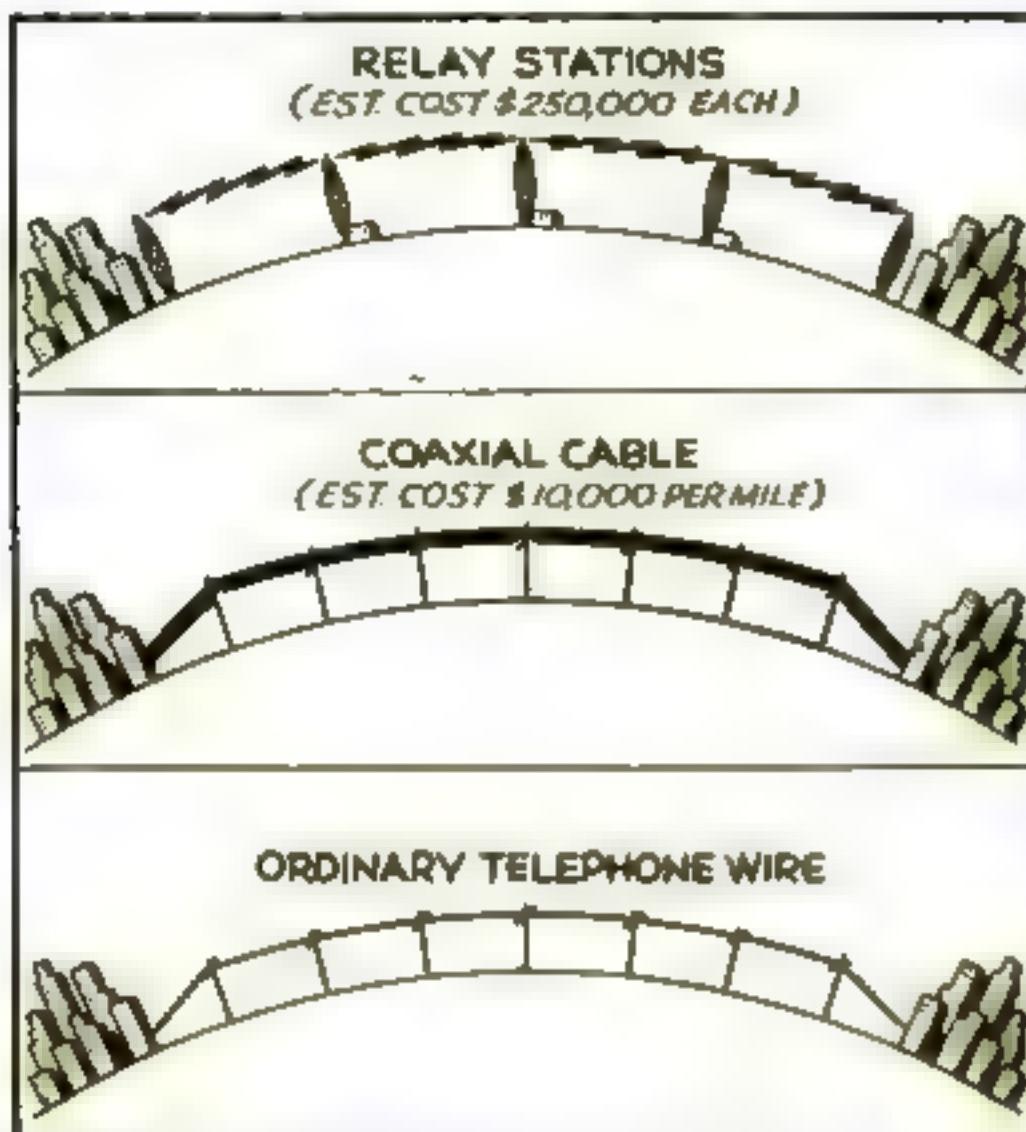

saving tire wear on crowned roads and in turning corners. Where dual wheels are employed without this feature, the tendency is for one wheel to drag the other, the inner tire wearing particularly where it takes extra weight or is abraded by drag. The wear is similar to that on badly underinflated tires or those on wheels that are out of alignment. Independent rolling, however, permits the outside wheel to travel a greater distance than the inner and prevents drag. The new development is the work of engineers of the Differential Wheel Corporation, of Detroit.

How dual wheels that roll independently must travel different distances while turning a corner. When mounted rigidly in pairs, one of the wheels drags.

TELEVISION NETWORKS MAY USE ORDINARY PHONE WIRE

Until now the range of television could be extended only by relay stations that were close to each other, or by the use of expensive coaxial cable, shown above. Transmission by ordinary telephone wire is believed possible with new circuits, thus making network television a reality.

NEW circuits said to afford recordings of television programs and also to make network hookups possible over common telephone lines may speed the day of sight-and-sound programs on a scale comparable to radio.

Because the extremely short waves used for television transmission travel in straight lines much like light, their range extends only to the horizon, about 30 miles in the case of most transmitters. To cover greater distance, two or more transmitters have had to be linked either by a series of costly relay stations 30 miles apart, or by a coaxial cable such as is used in long-distance telephony. While relocation of the television spectrum among the longer wavelengths might extend the range of transmission (just how much is not known) the broadcast bands are already so crowded that this is a doubtful solution.

That transmission over phone wire isn't impossible was shown in 1939 when television signals from Madison Square Garden in New York were successfully transmitted over ordinary telephone cables to the N.B.C. studio at Radio City, a distance of less than a mile. Special measurements and altera-

tions had to be made on the cable before use, however, and signal loss was about 1,000,000 times that over the same length of coaxial cable. The conclusion was that ordinary lines could not be used except for very short distances.

The new circuits, developed by Raymond Binney for the Packard Manufacturing Corporation, require changes in the receiver but none in the camera or the cable. According to Homer E. Capehart, president of the company, they promise to make coast-to-coast hookups available at no greater cost than that of equivalent radio networks. In a demonstration, television signals were sent over 12 miles of telephone line and a shorter coaxial cable with no appreciable difference in quality. The line was wrapped about electric motors and other devices that ordinarily cause video distortion, but it is said no interference was apparent.

Mr. Capehart also announced that the new circuits make possible the recording of television signals on wax records. This requires impressions of 500,000 cycles per second or more, but the company's researchers are confident that up to 1,000,000 cycles will eventually be recorded.

FAST JACKSTONE GAME USES SWINGING BATS

By MYRON FLEISHMAN

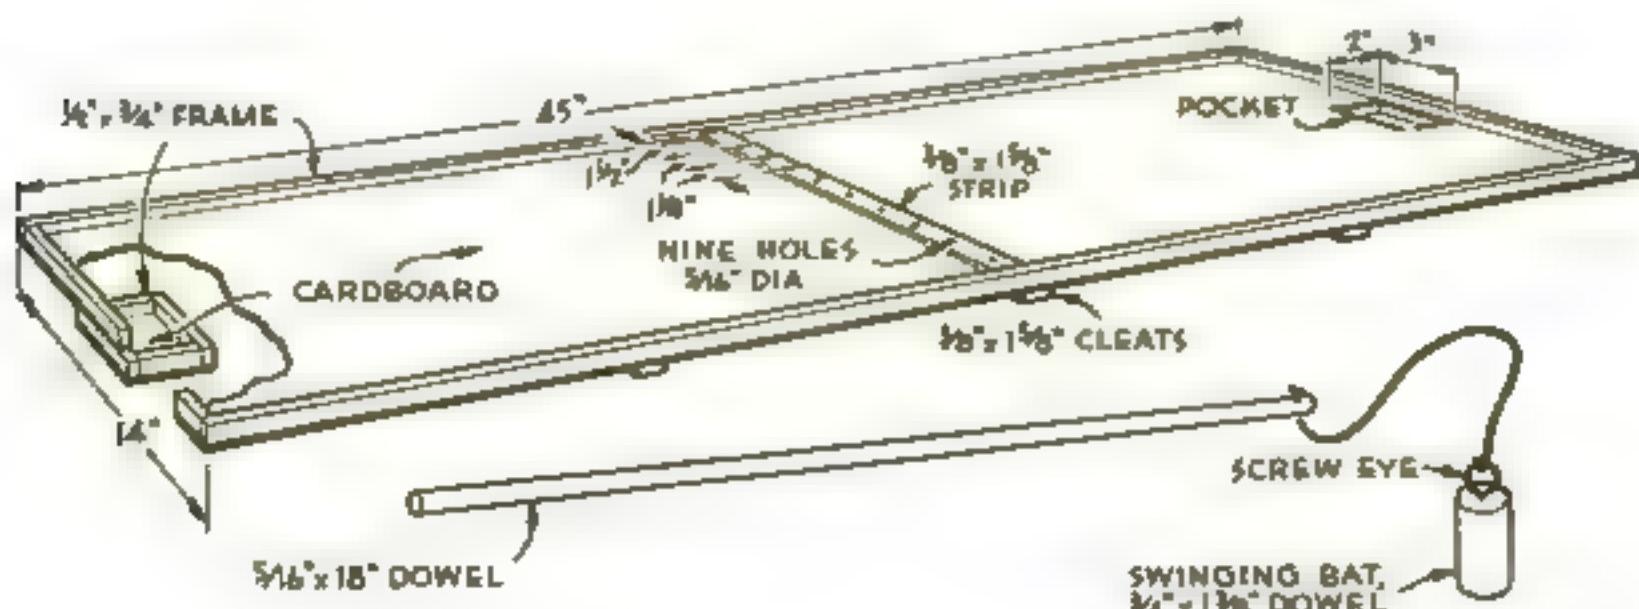

FOR a fast, modern version of an ancient game, make a board and two pendulum-swinging bats to use with jackstones. Then pit yourself against an opponent and, at the word "go," start batting jackstones toward the pocket at your end of the board. It is a game that will provide amusement for grown-ups as well as for children.

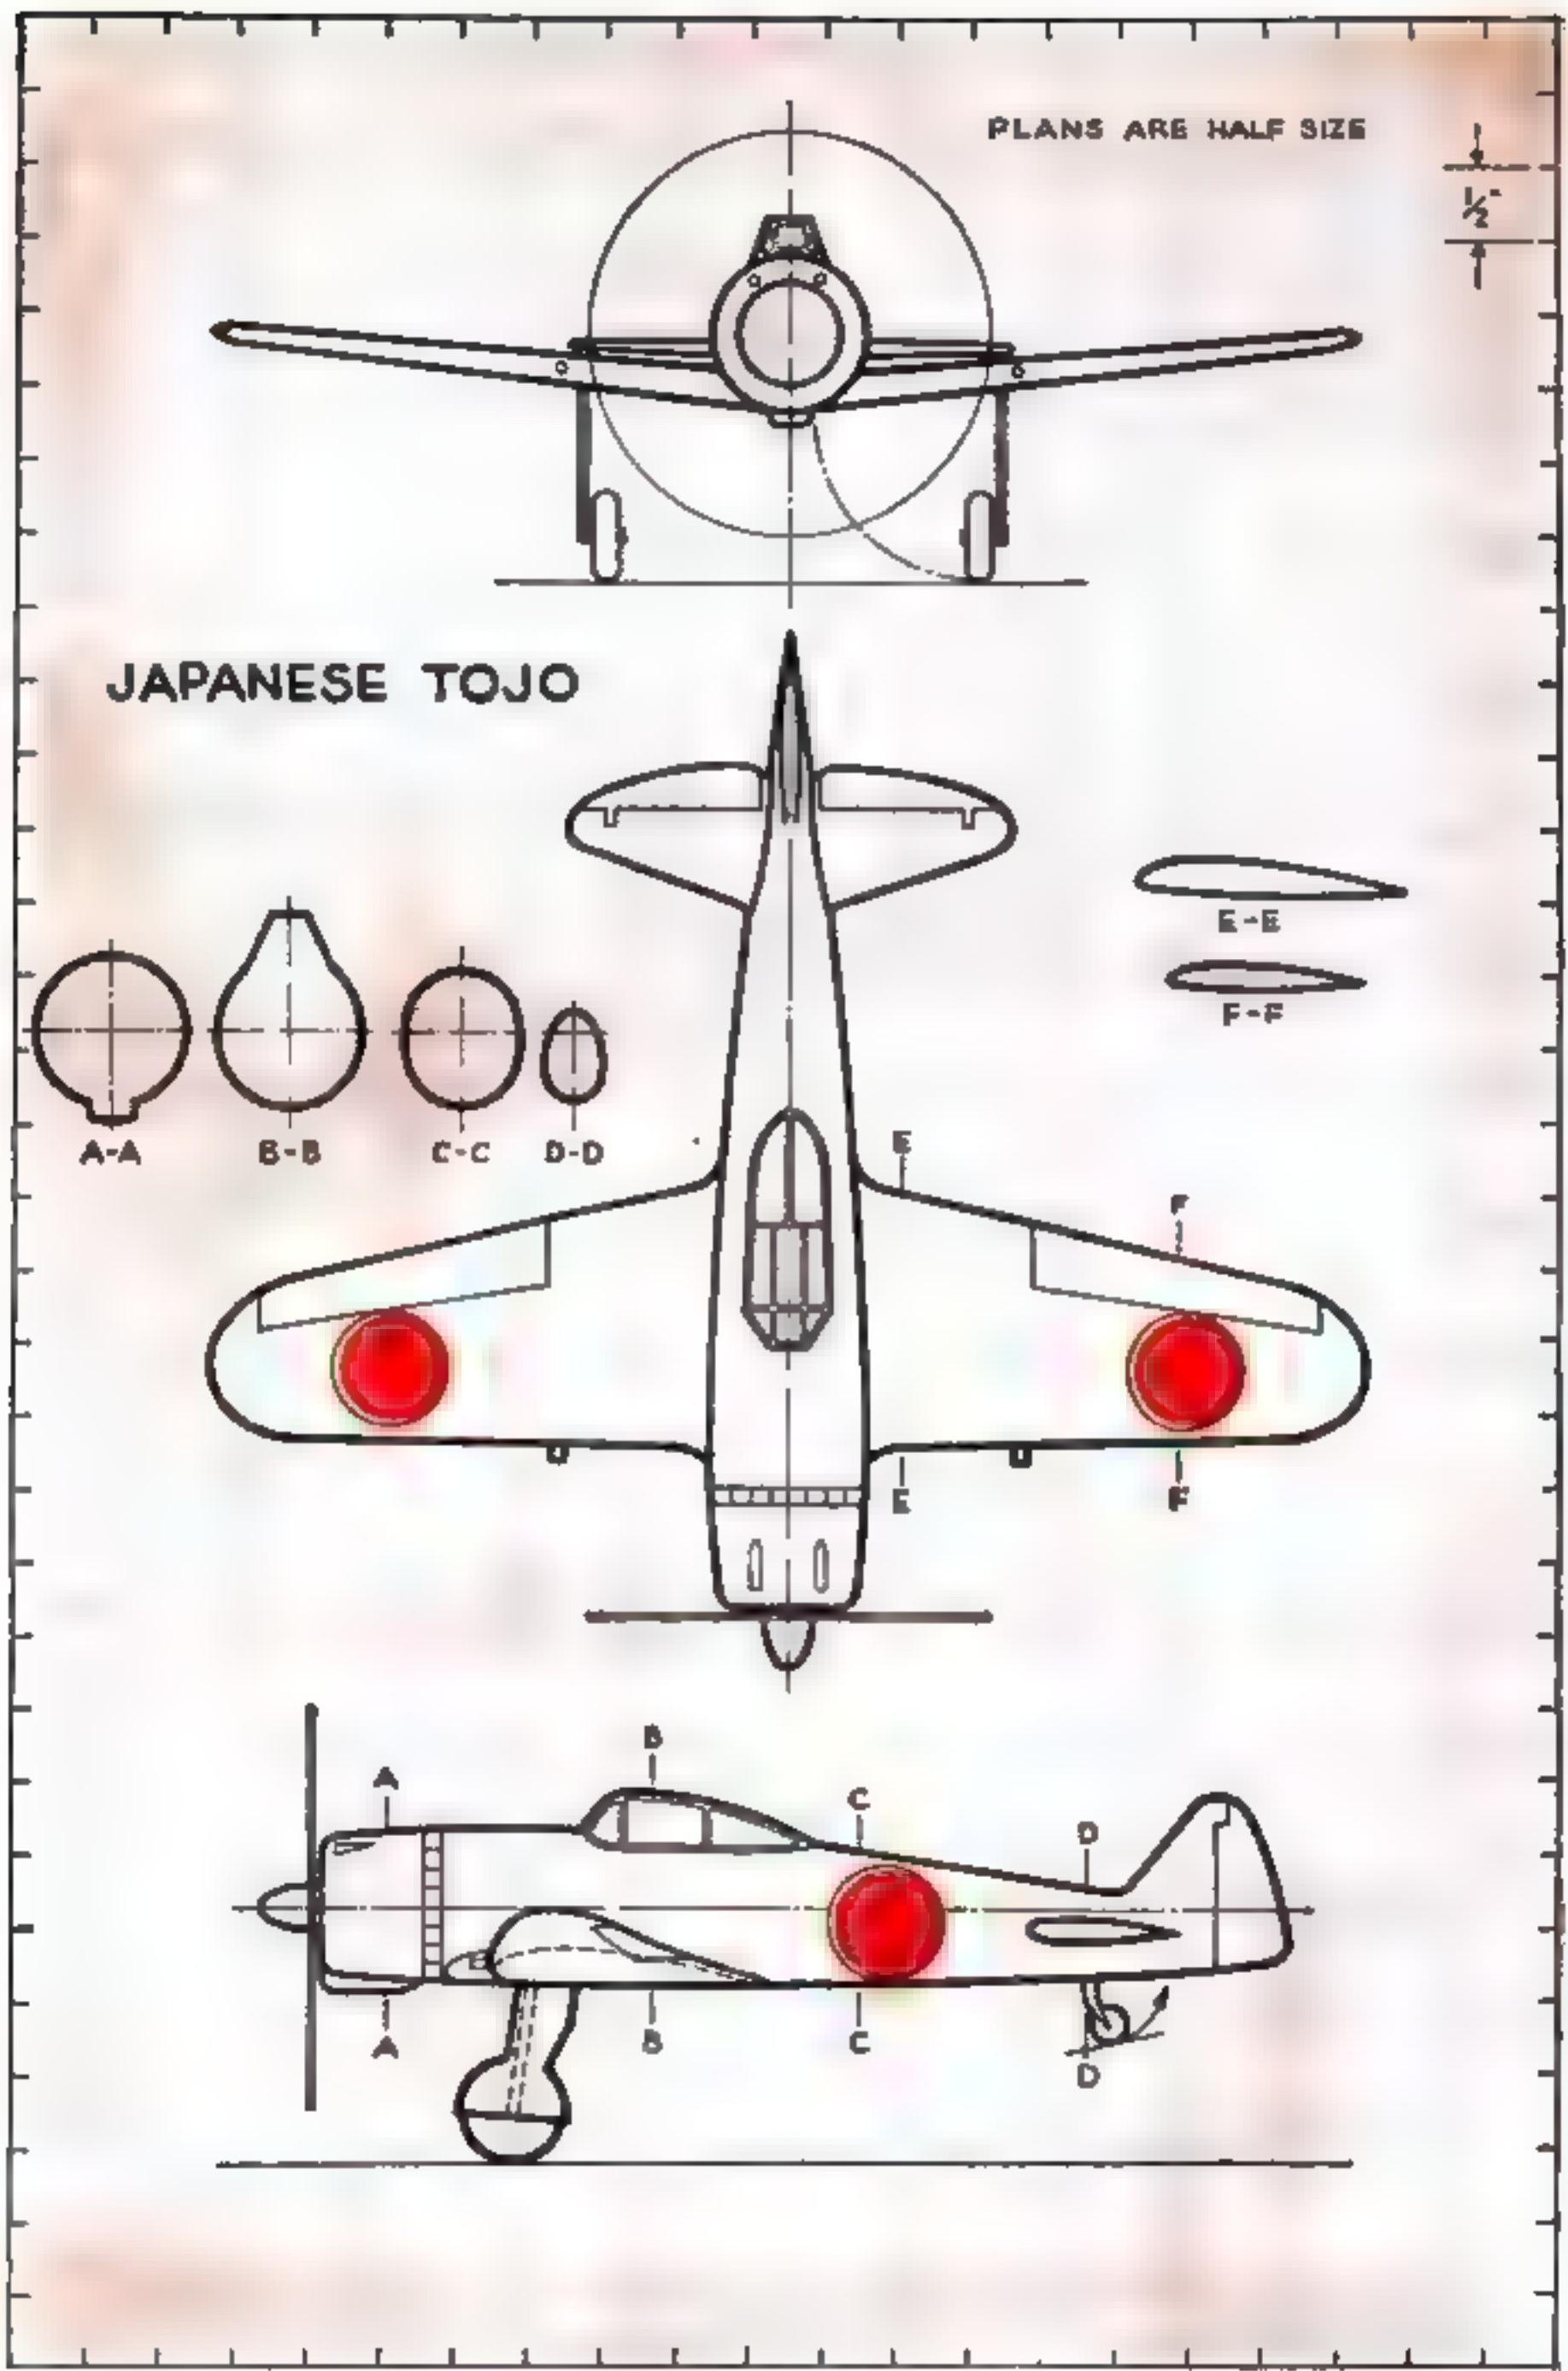

Build a simple 14" by 45" frame with butt joints, as shown in the drawing, and tack cardboard to the bottom. Two sheets of cardboard may be used if one 45" in length is not at hand, for the joint at the center will be covered by the starting strip and will not interfere with play. This strip is bored

with nine holes to take the nine jackstones required for a game.

Pockets at the ends of the board are also simple butt-jointed frames glued to the bottom of the cardboard which has, of course, been cut out to provide the necessary openings. Cleats of the same depth as the pockets make firm supports.

Each bat is made with a short dowel suspended by a cord from another dowel that serves as a handle. With some practice this can be swung so that the short dowel can be controlled in batting jackstones toward your pocket. Play until all jackstones are in pockets, contesting possession of any you wish. Count one point for each pocketed jackstone and play three sets for a complete game.

RECOGNITION MODEL OF THE TOJO

Building in Miniature One of the Newest Japanese Fighters

THE Jap makes a poor combat pilot. He is inclined to lose his nerve. Sometimes this causes him to stall his plane so it sits for precious moments at the mercy of his adversary. At other times he refuses to come to grips with the enemy, preferring to stay out of range and spray the sky with his ammunition until it is expended, and then high-tailing for home. But—although you would never guess it from the box scores—he doesn't build bad aircraft. His fighter planes are held in high esteem by our airmen. For example, one of the latest Nipponese fighters—the single-seater, single-engined Tojo—has a top speed of about 380 m.p.h. and a formidable array of armament. With a wing span of only 31 $\frac{1}{2}$ ', it is a watch charm of a plane. It resembles Germany's well-known Focke-Wulf 190. Unlike the early Zeros, it is well armored, ensuring protection for the pilot. The radial engine, a Nakajima Type 2, develops 1,400 hp.

The model is built of wood, preferably balsa or white pine. Lay out the fuselage profile on a block that measures 1 $\frac{1}{4}$ " by 1 $\frac{1}{2}$ " by 7"; then cut away the excess wood. Draw the plan view on the block and again cut away the excess material. Carve a notch in the bottom for the wing and another farther back for the stabilizer. Shape the blank to agree with the accompanying fuselage sections and sand it to a smooth finish.

Make the wing from $\frac{1}{8}$ " by 2" stock. Cut it to the shape shown in the plan view; taper it toward the tips as indicated in the front elevation; then, with a sharp knife and sandpaper, carve it to the proper cross-sectional shape, using the two wing sections on the opposite page as a guide. Clamp one end of the wing to your workbench, score the top surface along the longitudinal centerline, crack the wing at the scored line, and raise the free end so there is $\frac{1}{8}$ "

clearance between the tip and the bench. Support this end with a block of wood and cement the centerline crack. While this is drying, make the stabilizer in a similar fashion, using $\frac{1}{8}$ " material. It is not necessary, of course, to crack this piece, as it

has no dihedral. Glue it and the wing to the fuselage, holding them in place with pins until the glue dries. Fill the crevices around the wing root and the stabilizer with wood putty, building it up to form fairing fillets.

Make the fuselage-mounted machine guns and the wing-mounted cannons from thin doweling or match sticks. Go over the entire model with fine sandpaper; then apply several coats of wood filler to the surface, sanding lightly between coats. Finish with a dull camouflage paint. This should be greenish

brown in color—somewhat darker than the olive drab used a few years ago. Paint the canopy white and outline it with thin black lines.

Use a disk of celluloid to simulate a whirling propeller. Cement it and the propeller spinner to the nose. The insignia are red circles.—BILL SPRAGUE.

MUSIC AND COOKING are the hobby and vocation of T/4 Jacobus Theddorou, former New York restaurant proprietor and now a cook at Camp Reynolds, Greenville, Penn. Theddorou spends his leisure time fashioning violins at a barracks bench, putting more than 250 hours on each violin and finishing it with 15 coats of varnish. He makes his own tools and clamps.

CRAFTSMEN AT WORK

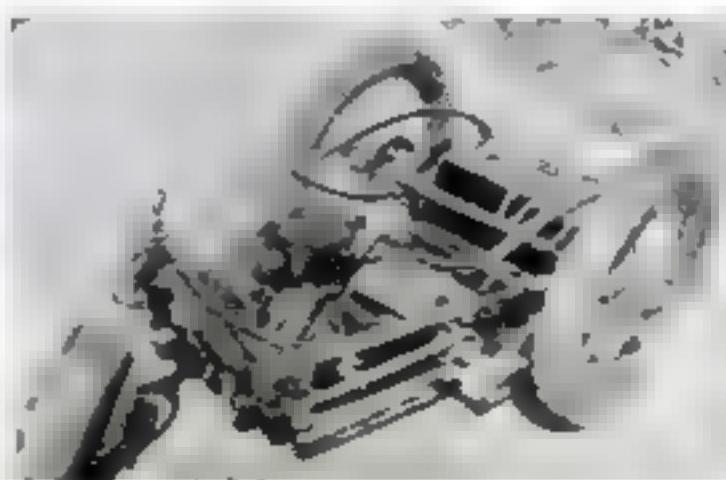

BUILT FROM BLUEPRINTS of the original 25,000-lb. capacity power industrial truck, this 15" by 20" by 32" scale model is operated by a motor and has all the controlling devices of the full-size machine. It was made in 1,300 hours by O. R. Heidenrich, Pittsburgh district manager of the Elwell-Parker Electric Company.

BOTH GAS AND ELECTRIC MOTORS propel a runabout constructed by R. H. Hamrick, of San Leandro, Calif. The body is a motorcycle sidecar set on a frame of angle iron. Motorcycle wheels are used on the axle at the rear, while a 3½" by 12" wheel is attached to the steering post.

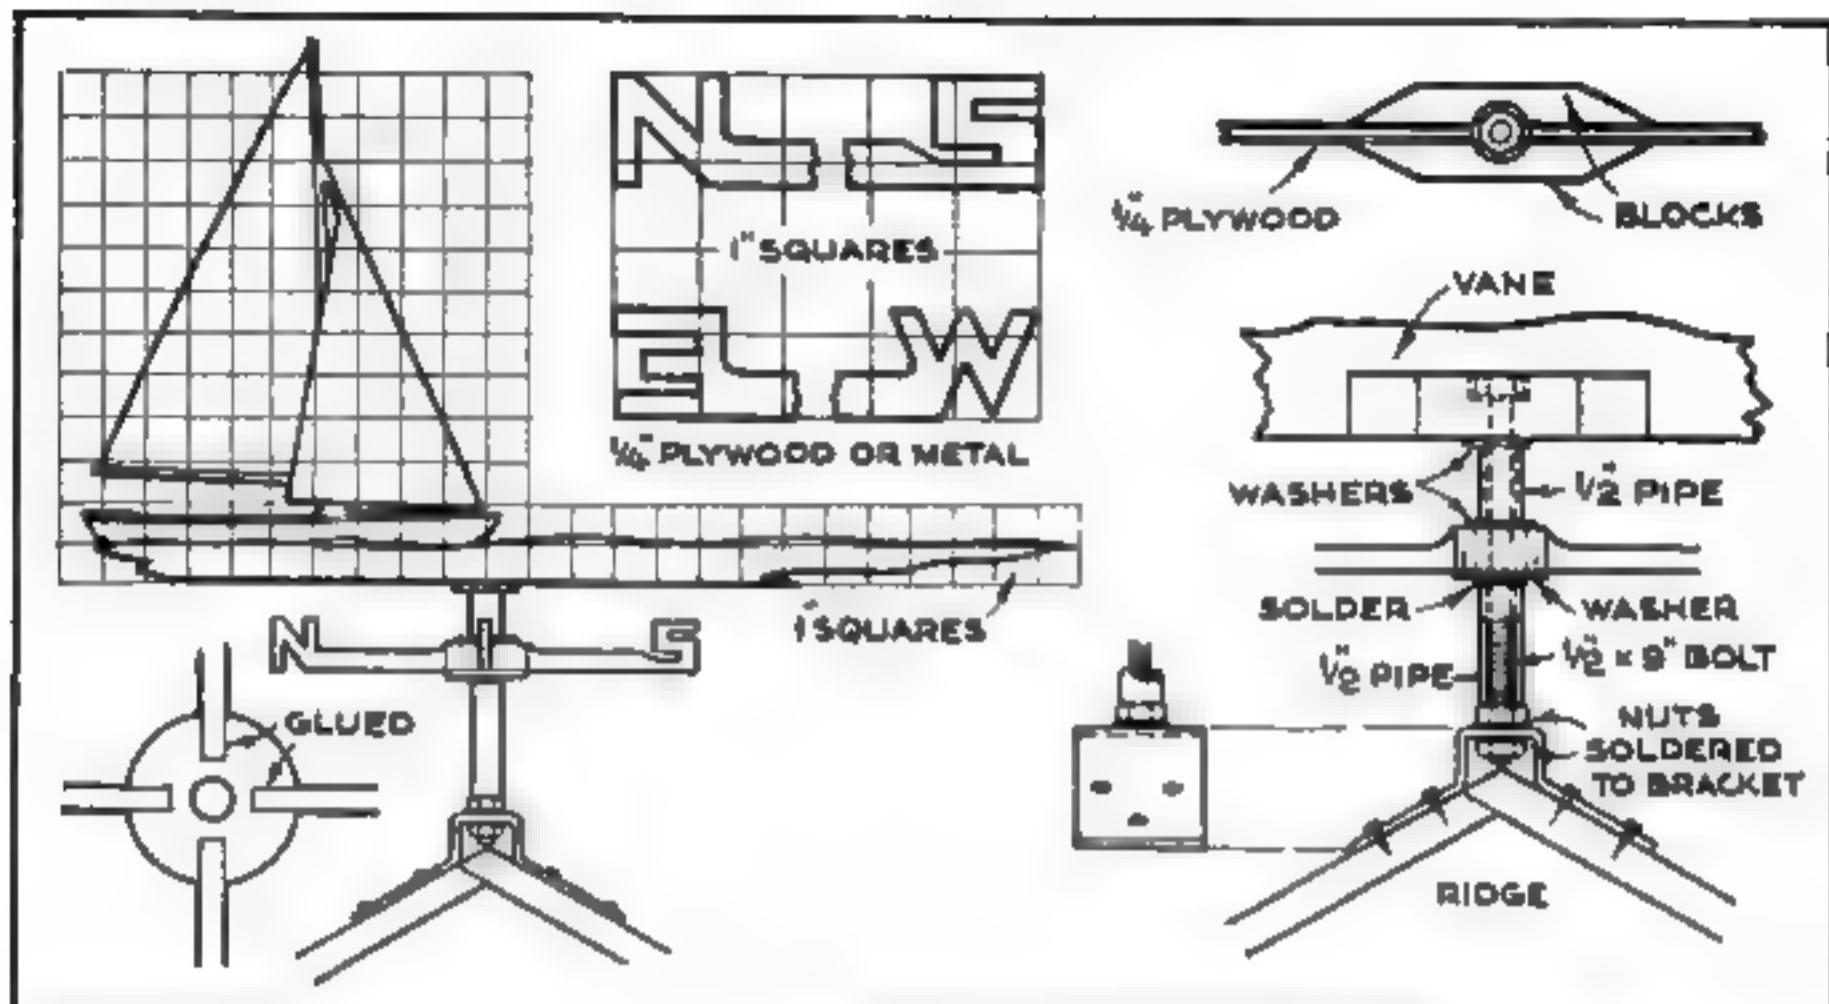

For starting and short drives, an old Dodge 12-volt starter generator is fed by two ordinary 6-volt batteries. It operates for about 15 miles on one charge. A rheostat controls the speed, and a double-pole double-throw switch permits reversing. Power on the highway is furnished by

a Briggs & Stratton ½-hp. gasoline motor that is engaged by a dog clutch. This engine may be started by the use of the starter generator.

MINIATURE FARM TOOLS and logging equipment are formed to scale from scrap steel by Alfred La Vasseur, master layout maker for the Douglas Aircraft Co., at Santa Monica, Calif. He has added commando knives for men in the services to his making of cant hooks, plows, picks, hoes, and scythes. The logging sled shown below with its load is one of his masterpieces.

Nautical Weather Vane for Your Garage or Boat-House Ridgepole

TO BUILD this weather vane, make patterns by laying out a grid of 1" squares on a piece of wrapping paper and, using the above drawing as a guide, sketching in the outlines of the vane and the compass-point indicators. Next, trace the patterns on your stock—either $\frac{1}{4}$ " plywood or 16-gauge metal can be used—and cut the stock to shape. Screw or rivet two bearing blocks to the vane at the point where it rests on the post. Glue or rivet the compass-point indicators

to a $9/16$ " i.d. collar of suitable material.

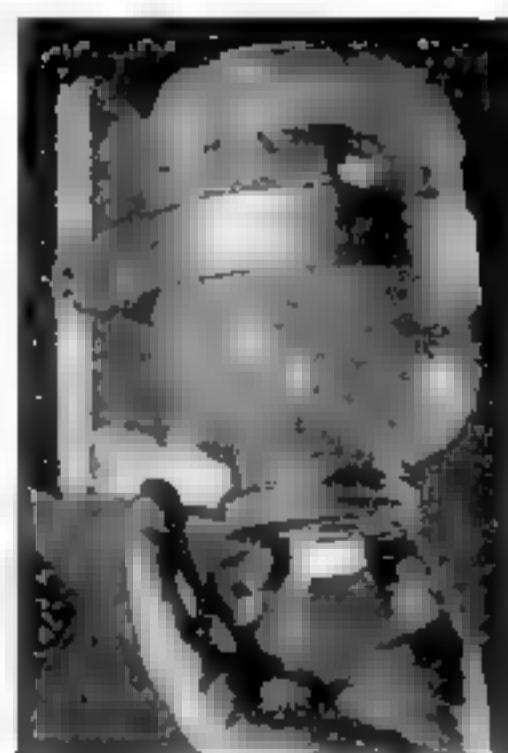

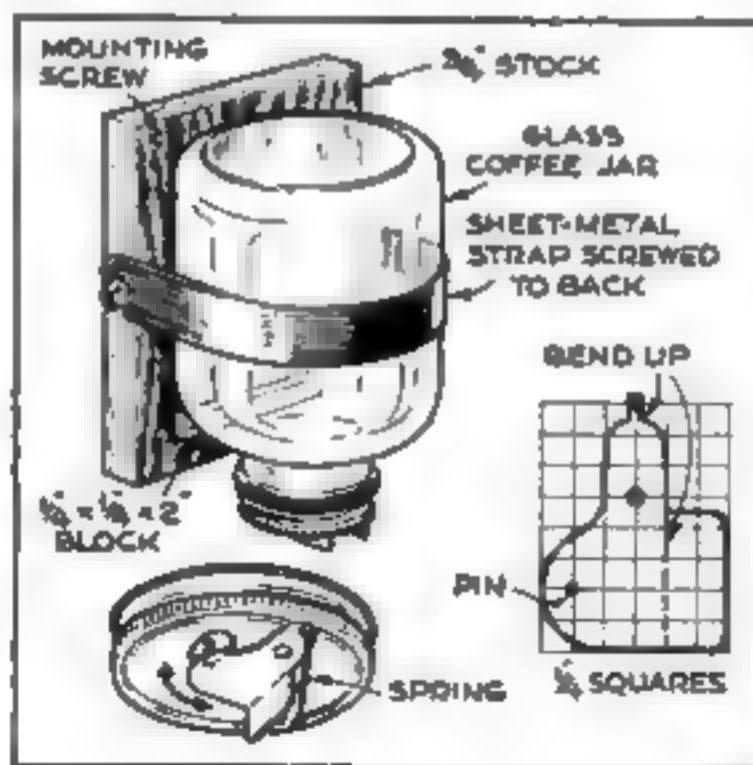

The post is built up of a $\frac{1}{2}$ " by 8" bolt, two nuts, three washers, and two lengths of $\frac{1}{2}$ " pipe. Assemble the parts, using solder where indicated, and mount the completed assembly on a bracket, which is made from flat bar and screwed to your garage or boat-house ridgepole. If wood or a ferrous metal is used in the construction, finish with two or three coats of waterproof paint of good quality.—WILLIAM F. CROSBY.

Simple Powdered-Soap Dispenser Utilizes Old Glass Coffee Jar

THIS soap dispenser is made from a glass coffee jar with a metal cover. Mount the jar on a $\frac{1}{4}$ " backing piece and hold it in place with a $1/32$ " by 1" sheet-metal strap, which is screwed to the back, and a $\frac{1}{4}$ " by $\frac{1}{4}$ " by 2" block, which is also fastened to the back and prevents the jar from slipping down.

The dispensing device consists of a shutter which is detailed in the drawing; a $1/16$ " pin, which is riveted to the shutter and passes through a hole in the cover to act as an agitator; and a return spring. The hole should be completely covered when the

shutter is closed and partially uncovered when the shutter is open. A small machine screw and nut, the latter soldered to the cover, hold the shutter.—A. O. BOHN.

HOW TO USE PAPIER-MACHE

Old Paper and Paste Will Make an Excellent Craftwork Material
You Can Adapt to Truly Distinctive Pieces of Your Own Design

PAPIER-MACHE, or paper pulp, has for ages been a favorite medium for craftwork. It is so simple to handle and so inexpensive to make that it is as practical for the novice to handle as modeling clay. Dolls, puppets, toys, figurines, bowls, and vases can be formed from it with little experience, and it is just a step further to the making of Halloween and Mardi Gras masks, store-window display figures, and enormous, grotesque animal figures.

As its name implies, papier-mâché is really paper chewed or torn and mashed into a pulp along with water and paste. For some types of modeling, however, such as bowls, trays, vases, and masks, many artists prefer to paste strips of paper together on a form rather than to use a mash or pulp. The principle remains the same, but the strips are somewhat easier to handle when the object is to be flat or hollow.

For either method, a commercial powdered wheat paste of the type used for hanging wallpaper will be found inexpensive and most satisfactory. If you wish to make your own paste, mix flour and cold water to the consistency of thin cream—a cupful of

By ELMA WALTNER

flour should be ample—and then add a little boiling water and stir over a low flame until the mixture thickens. A teaspoonful of alum will make the paste more adhesive, but isn't absolutely necessary, and a few drops of oil of cloves or cinnamon will preserve it if the mixture is to be kept for some time.

To make a bowl, use as a mold a smooth-surfaced vessel of the desired size and shape. Place this mold upside down over a jar or wood block; smear it with a light grease, such as petroleum jelly or a vegetable shortening; and then lay over it a layer of

torn or cut pieces of tissue paper, smoothing them on carefully to work out all wrinkles. The edges of the pieces should just touch; don't let them overlap too much, or there will be ridges on the inside surface of the finished bowl.

Now, using a small paintbrush, coat the entire surface of the tissue paper with paste, and then lay on, as in Fig. 1, wedge-shaped pieces and straight strips of newspaper that have been dampened in a container of water. Cover the surface with more paste, add a new layer of pieces of newspaper (Fig. 2), and alternate with paste and paper until the bowl has been built up to the desired thickness—about eight layers for a small bowl, or as many as 12 for a large one or for a plate or a tray. It is a good idea to use two different

On this wire frame, an appealing little toy dog can be built up of papier-mâché. A muslin or paper wrapping saves time in building up thick parts such as the body

types of paper, ordinary newspaper, for instance, and colored-comic sheets or brown wrapping paper. Then if the type of paper is changed for alternate layers, it will be easy to distinguish places you have missed and to fill in any chinks.

Take care to work out all wrinkles as each layer is applied, and do not let any of the edges overlap. Roughness can, of course, be smoothed with fine sandpaper, but it is easier to keep the layers smooth in the first place. Leave the piece on the mold to dry thoroughly. This may take several days. Mark around the edge a line for trimming, as shown in Fig. 3, and remove the piece

when it has dried. The tissue paper can be peeled easily from the inside.

Finish the piece with enamel or artists' oil colors, and you will have a bowl like that in Fig. 4, as attractive as it is useful. Oil colors take longer to dry than enamels, but lend themselves more to hand decorating.

Vases may be made by the same process, using a glass jar for the inside. Since they

Bits of pulp mixed with paste are put on and pressed to the frame. Shape roughly as you add each new pulp dab

Finish the modeling with the fingers or a flat stick. After the piece has dried thoroughly, apply enamel or oil paint

will hold water, it is best not to grease and remove the glass. Other jars may be pulled off the form if the opening is at the large end. Or, where one cannot be pulled off readily, let the piece dry when only two or three layers have been applied; then slit one end of the piece, pull it off, join the cut places with pasted strips, and put on four or five more layers.

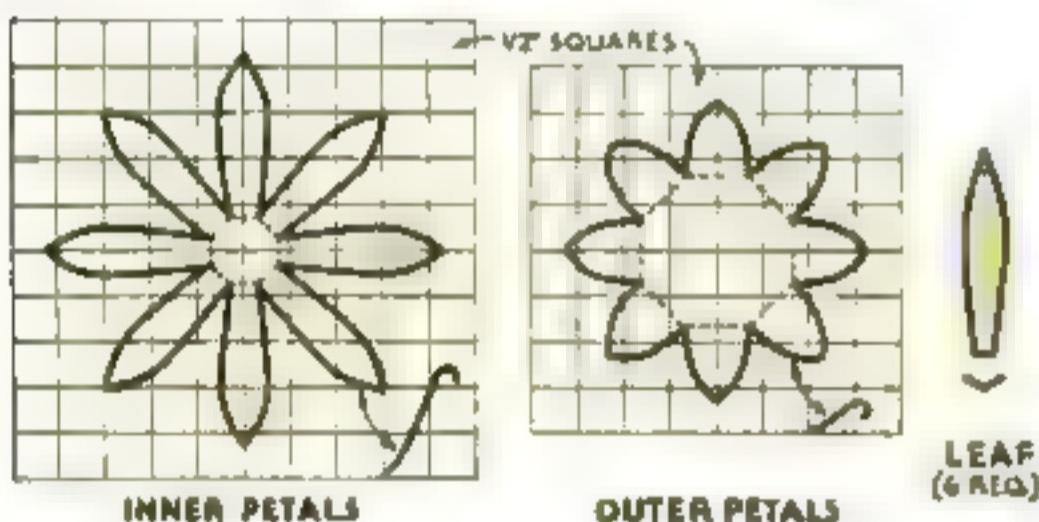

Pulp is used for the toy dog shown. Tear several sheets of newspaper into tiny pieces, pour on hot water, and let the mass soak overnight or longer. When you are ready to use it, masticate it further on a washboard or with the fingers, drain off all the water you can without squeezing, and mix in enough paste to form a dough. Now press out all the water possible so there will be little shrinkage when the finished piece dries. The pulp should be the consistency of modeling clay and should not stick to the hands. Build up the dog or desired figure on a wire or other frame, or model it from a ball as you would with clay. Finish with enamel or oil colors.

Bud Vase from Tin-Can Stock

THIS modern vase for holding a single bud can be made quickly from tin-can metal, clothes-hanger wire, and a standard test tube. Cut out patterns of stiff paper for the base and ornamental leaves, as shown in the drawing, trace the outlines on tin-can stock with a scribe, and cut out the pieces with tin shears. Bend the six leaves in a vise along their centers; then bend and curl the base petals and the ends of the leaves with round-nose pliers.

Clean the wire with fine steel wood or emery cloth. Bend $\frac{1}{8}$ " of one end at right angles, hammer this flat, and shape the spiral around a dowel the diameter of the test tube. Solder the bent end of the spiral to the inner petals, solder on the outer petals, and then solder on the leaves. Polish with fine steel wool, apply clear lacquer to keep the metal bright, and insert the tube.—CARL W. BERTSCH.

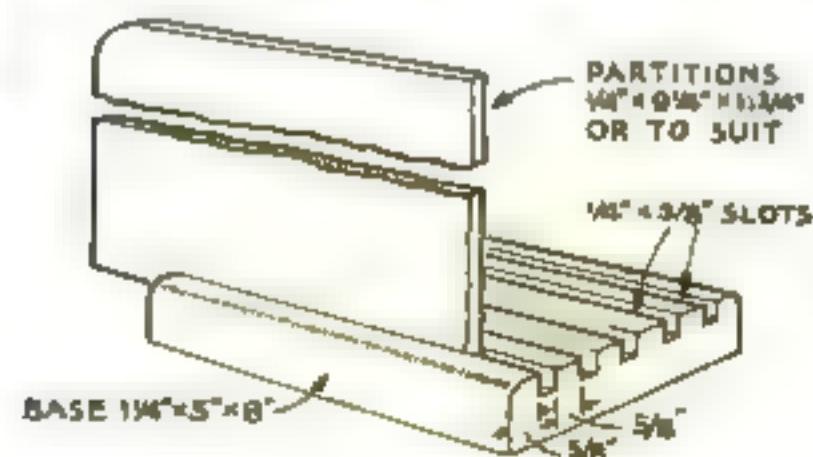

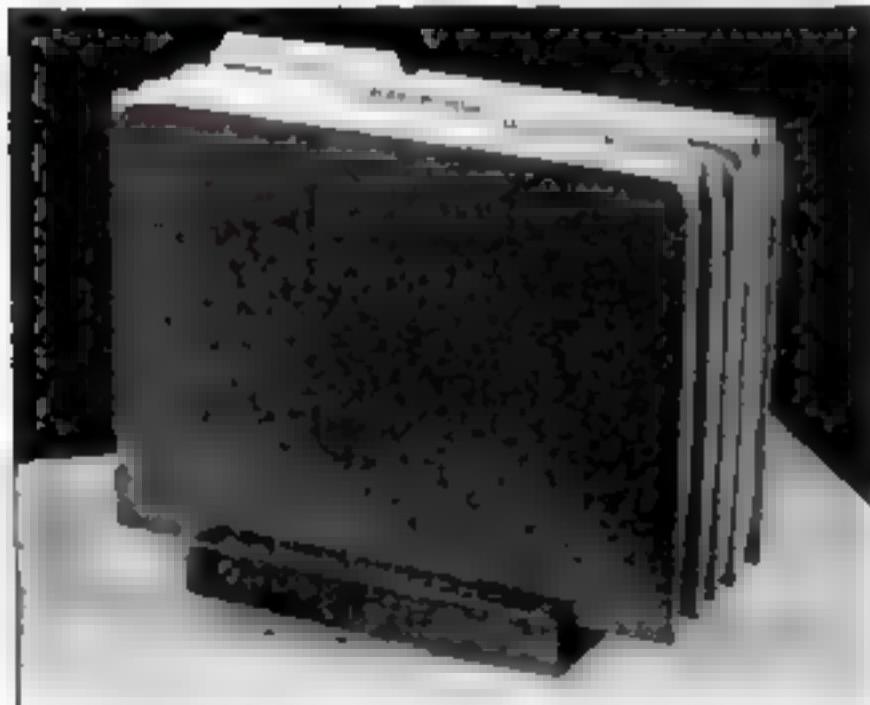

Partitioned Desk File Keeps Important Papers Separated

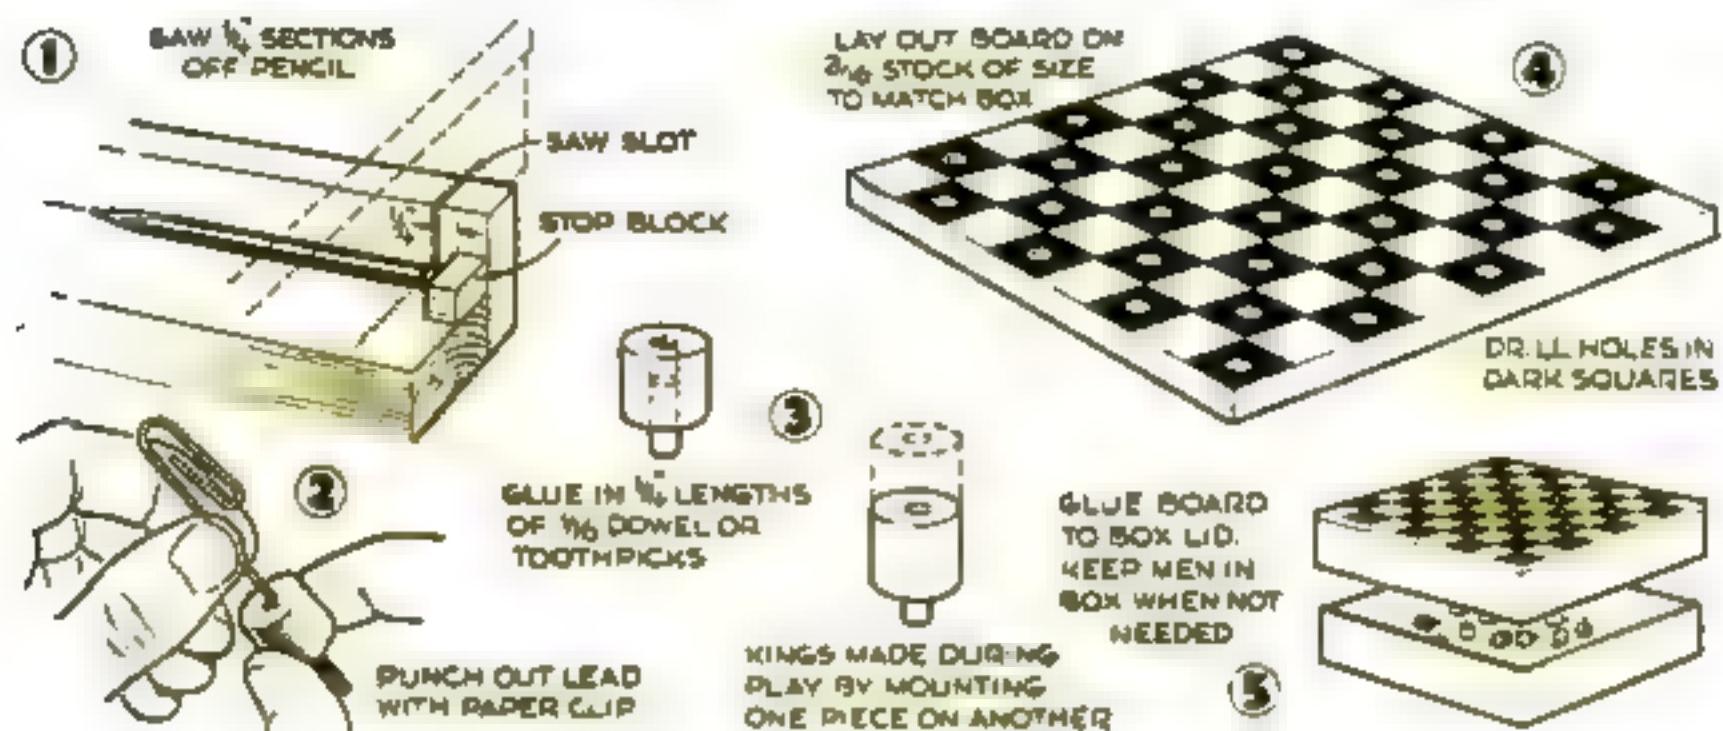

SIMPLICITY and convenience mark the handsome letter file shown below. It can be made of hardwood and finished to match the desk on which it will be used, or the base

may be of any scrap stock and the partitions of plywood or composition board for a lacquered or enameled finish.

Grooves in the base for holding the partitions can be cut quickly on the circular saw or with a hand dado plane, or the base may be built of a solid piece with strips glued on $\frac{1}{4}$ " apart to form the grooves. Round opposite sides of the base—the slotted ends as in the photo, or the front and back as in the drawing if this is found easier with a rasp. Finish to suit the materials selected.

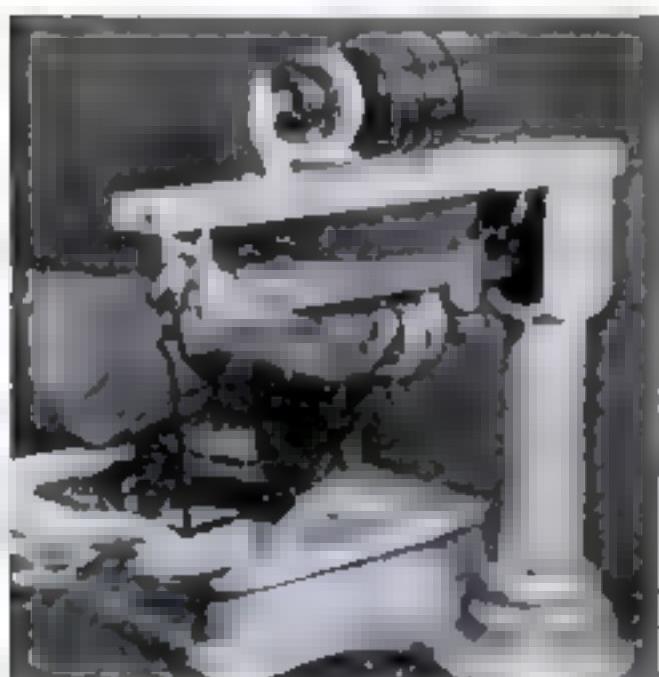

Checkers Cut from Colored Pencils Are Used in Portable Board

CHECKERS that can't be upset, and a combination board and box to hold the pieces, are practical features of this game unit. The checkers are sawed in the simple jig shown from round or hexagonal pencils of two colors. After the lead cores have been removed with a paper clip, small dowels or tooth picks are inserted and

glued. A small, sturdy box serves as a base for the board, which is cut from 3/16" stock and glued to the box top. A colored pencil may be used to tint half of the squares in the checkerboard pattern, leaving the uncolored wood to mark the other squares. Holes are then drilled in the center of each of the dark squares.—F. MITCHELL.

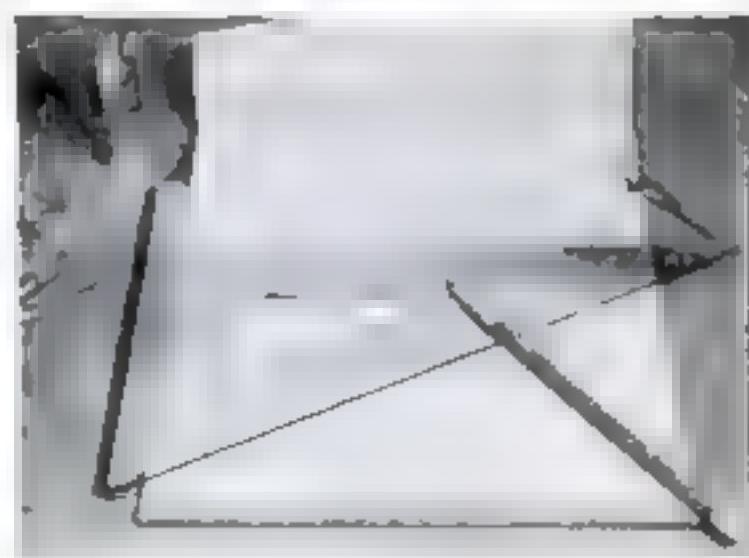

Colored Scale Weights Speed Up Work and Reduce Possibility of Error

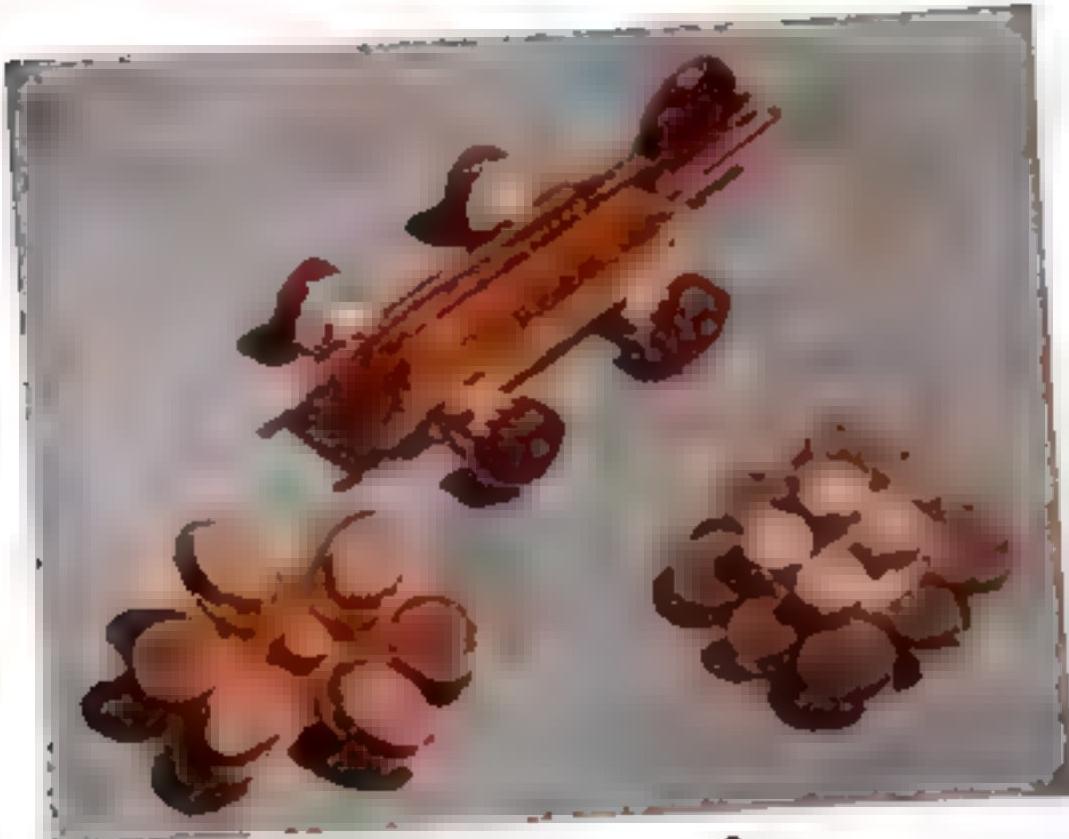

EVEN a drab, work-a-day instrument like a platform scale may be brightened up and operated more efficiently by painting each weight in different colors. Bright hues make the weights easy to find when they are misplaced, while painting simplifies the process of selecting them from the scale-weight rack by combining touch and color identification. In this way, errors made in selecting weights are largely eliminated. Apply bright shades of different colors of enamel or lacquer to the weights. House paint may also be used, but avoid water color or casein paints as they may rub off in constant use.—W. E. B.

Plastic Triangle Forms T-Square for Full-Vision Drafting

DRAFTING on small pads or drawing boards is often awkward when a full-sized T-square is used, and particularly so since the square obscures much of the paper drawing surface. A drafting tool that eliminates this defect can be made from an ordinary 10", 60-deg. plastic triangle and two pieces of $\frac{1}{8}$ " by $\frac{1}{2}$ " by $7\frac{1}{2}$ " strip steel, brass, plastic or hard wood. Clamp the strips flush to each face of the short side of the triangle. Three equally spaced holes are then drilled through the strips and counter sunk. After riveting the strips, the clamps are removed, and the rivets and sharp corners rounded off.—J. C. MAGEE.

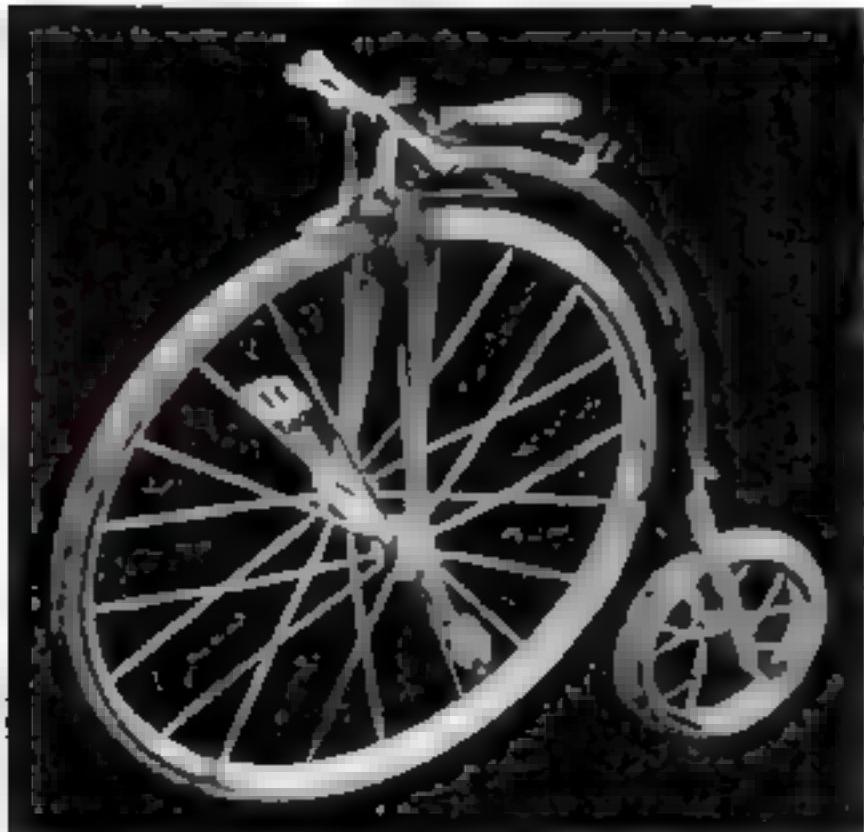

WINNERS IN OUR DOWEL CONTEST . . .

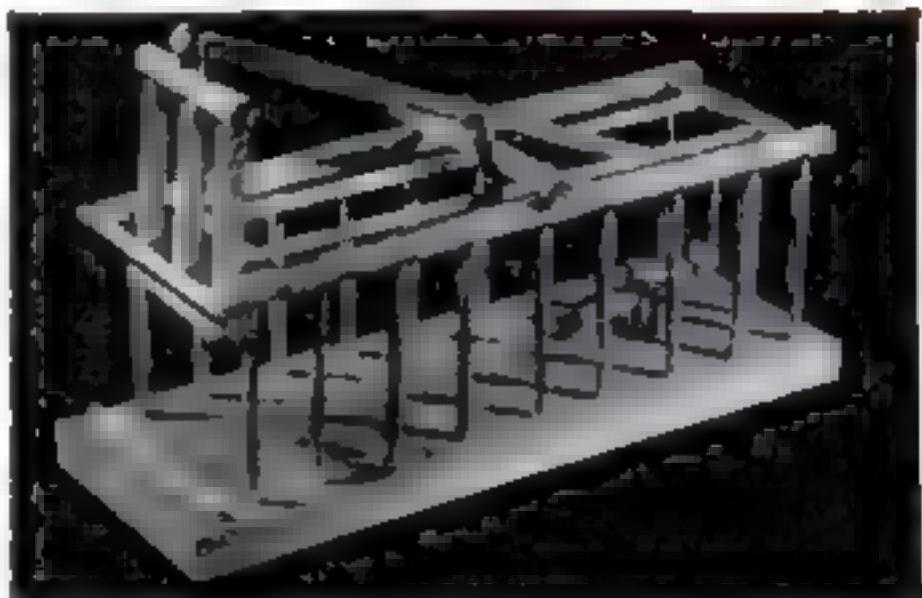

Four of the articles submitted by first-prize winner Frank W. Dresser—a futuristic rocket-car model, two lapel ornaments for the ladies, and, at the right, a wall-mounted knife holder

INGENUITY was the outstanding characteristic of the entries in P.S.M.'s recently completed dowel contest. So hard put were the judges in their efforts to pick the winners that they finally duplicated the \$25.00 first prize by awarding a \$25.00 special prize to the contestant who submitted the bicycle that is shown below.

Special-prize winner A. A. Avritt's entry was this nostalgic replica of an old-fashioned big-wheeler. Dowels were used for everything except the wheel rims, which were turned from a piece of flat stock

H. W. Gerdts won second prize with the rabbit-trap model shown above. In compliance with the rules, he used but one piece of flat stock, making the base from it. The gate actually falls when tripped

LIST OF PRIZE WINNERS

- 1st Prize: Frank Dresser, Philadelphia, Penna.
- Special Prize: A. A. Avritt, Owensboro, Ky.
- 2nd Prize: H. W. Gerdts, Brooklyn, N. Y.
- 3rd Prize: Donald Schultz, St. Joseph, Mo.
- 4th Prize: George Covitrip, Berlin Heights, Ohio.
- 5th Prize: Joseph Ruel, Fifty Lakes, Minn.
- 6th Prize: J. B. Lighton, Los Angeles, Calif.
- 7th Prize: I. M. Fenn, Chicago, Ill.
- 8th Prize: Edward Stelmaszyk, Buffalo, N. Y.

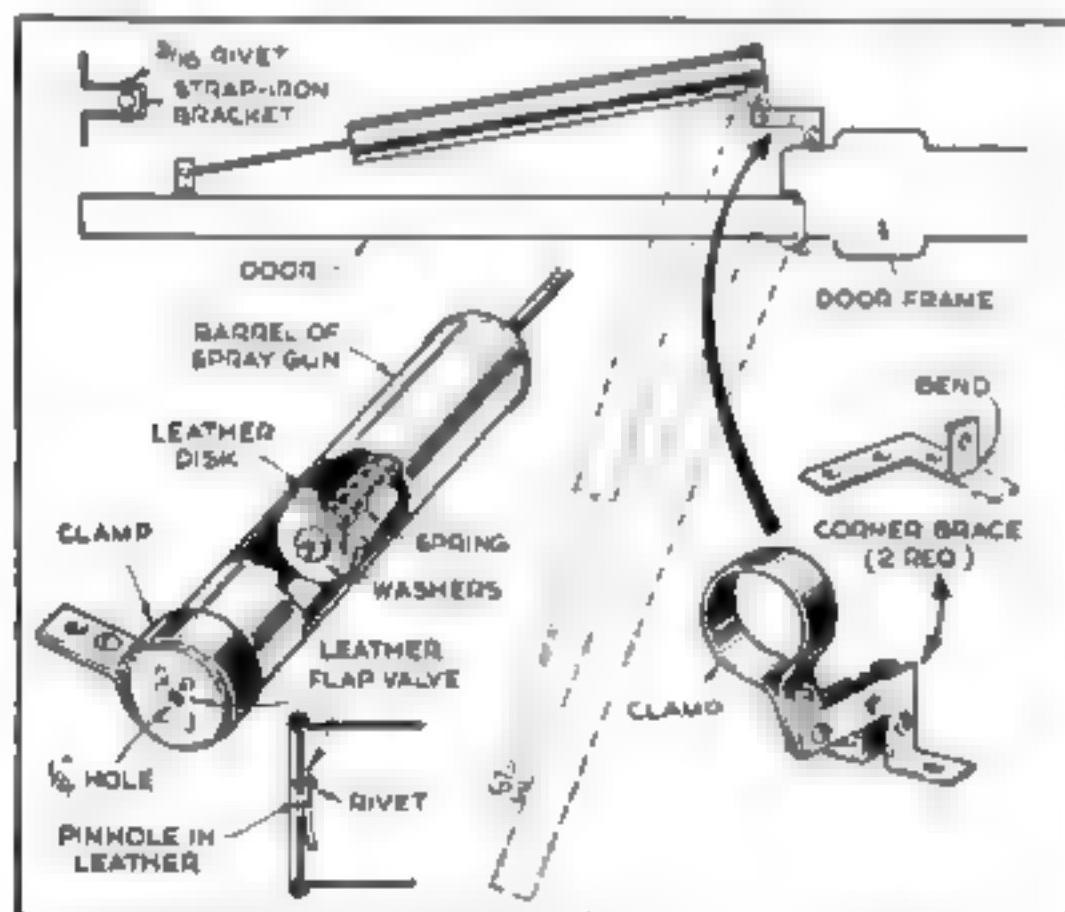

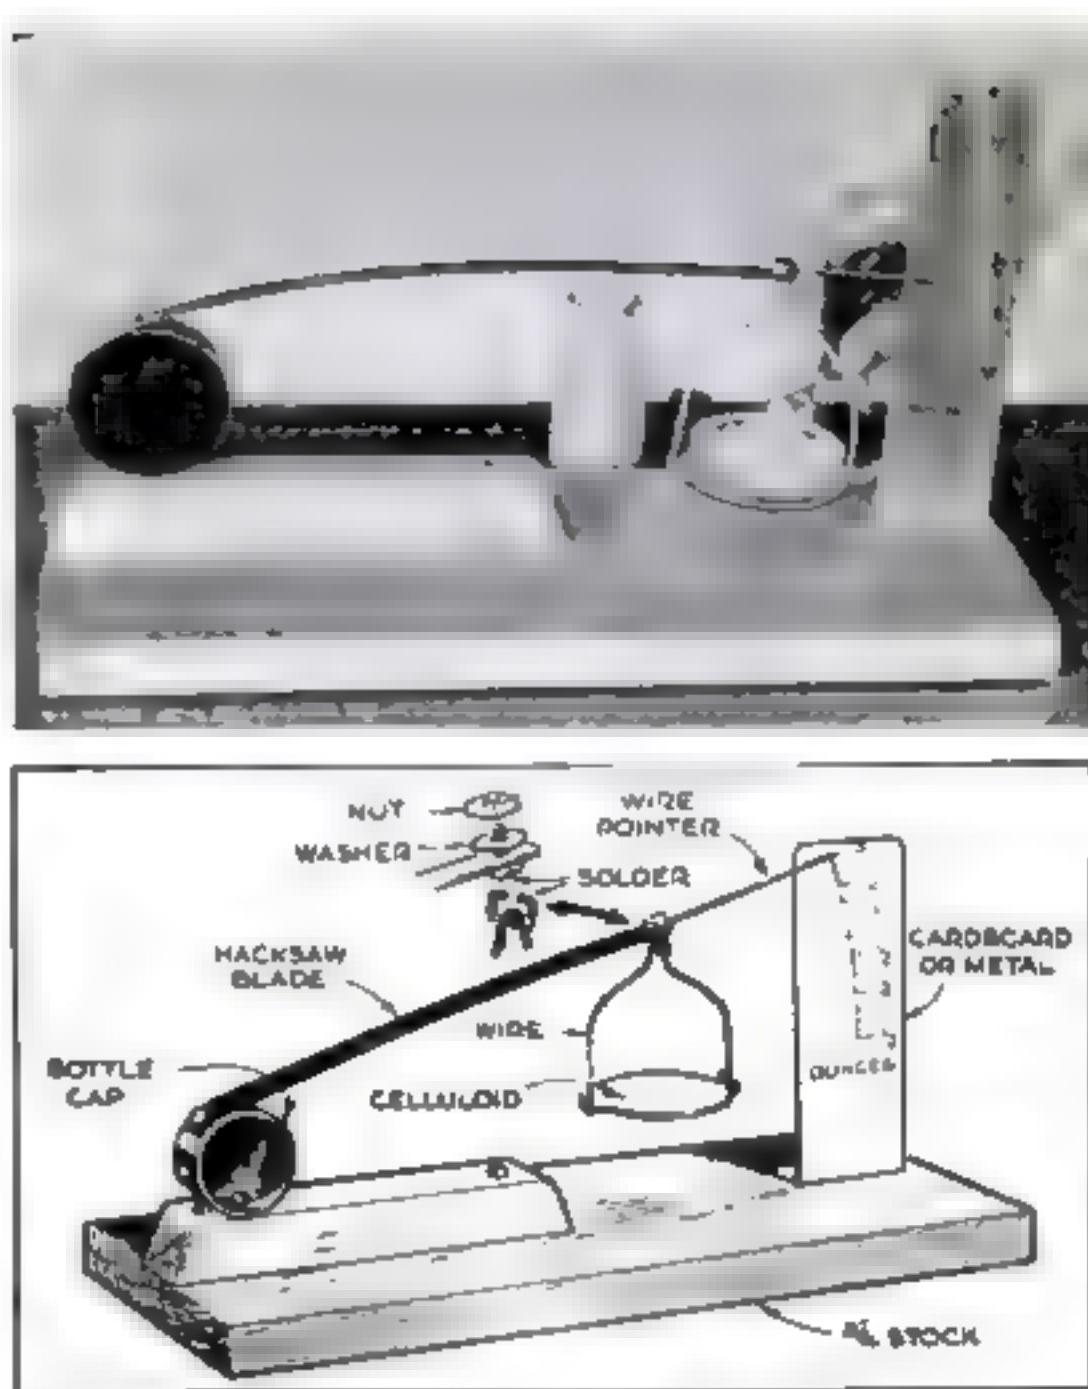

Sensitive Chemical Balance Made from Hacksaw Blade

ACCURACY in your chemistry experiments, or in measuring photographic chemicals, will be increased by a sensitive balance. One that will measure to .05 oz. can be made from such simple materials as an old hacksaw blade, a screw cap from a canning jar, and a few lengths of wire.

Grind the teeth off and anneal, if necessary, to drill a hole about 2" from one end; then drill two holes in the jar cap as shown so the blade can be bolted to it. Screw the cap to a wooden base through a third hole. Fasten the balance pan and a wire pointer at the other end of the blade, and set up a cardboard or metal scale on which the pointer will register. Calibrate with fairly new coins according to the following table:

| | |
|-------------------|-------------|
| Dime | 38.5 grains |
| Penny . . . | 48 " |
| Nickel . . . | 77 " |
| Quarter . . . | 96.5 " |
| Half dollar . . . | 193 " |

If you wish to calibrate a scale in fractions of an ounce, 437.5 grains equal 1 oz.—ROBERT F. BENENATI

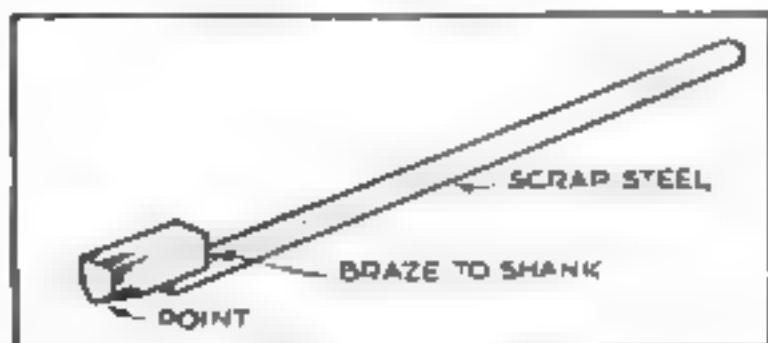

Spring Fitted to Piston Closes Door Silently

IF YOU are troubled by slamming doors, you can make an automatic closer from the barrel of a spray gun, a homemade piston, and an ordinary door spring, as shown in the drawing at left. For use on a screen or storm door, the bracket can be altered to fit between the outer and inner doors.

Make up the piston from a leather disk that will slide easily in the cylinder and from two washers slightly smaller in diameter. Attach them to the threaded end of the piston between two nuts. Solder the cylinder end back on after inserting the piston.—BERNARD MIGLIARO.

Glass Cutter of Tungsten Carbide

BRAZED to a short shank, a scrap from an old tungsten-carbide tool bit will make an excellent glass cutter. This tool alloy is exceptionally hard. Grind the point on a diamond or silicon carbide wheel to the shape shown and keep it sharp.—CARROLL MOON.

Eighteenth Century

AN HEIRLOOM YOU CAN

By Frank Hegemeyer

THIS three-footed stand is a charming piece that follows the trend of the master cabinetmakers of the eighteenth century. Besides making a handsome addition to the furniture of a living room, it will serve admirably for the display of a favorite statuette or potted flowers or greenery.

The three turned columns present no difficulty except that they must be accurately centered in the lathe because of the square sections at the ends and in the middle. All necessary dimensions are given in the drawing. If your lathe will not accommodate a 28" length, it is possible to make each column in two pieces and join them with dowels. In this case, have the lower section contain the center square portion.

Three pairs of dowel holes are bored in the lower plate, while only three holes are required in the upper one. First cut a paper template to the shape of the lower plate, and then spot the six holes on it as shown. Place this pattern on the bottom of the lower plate and transfer the location of the holes with the point of a nail or an awl. The three inner holes of the pairs are then bored part-way through to take the inside dowels from the legs, and the outside holes of the pairs are bored all the way through so that a single dowel through each will join both a leg and a column.

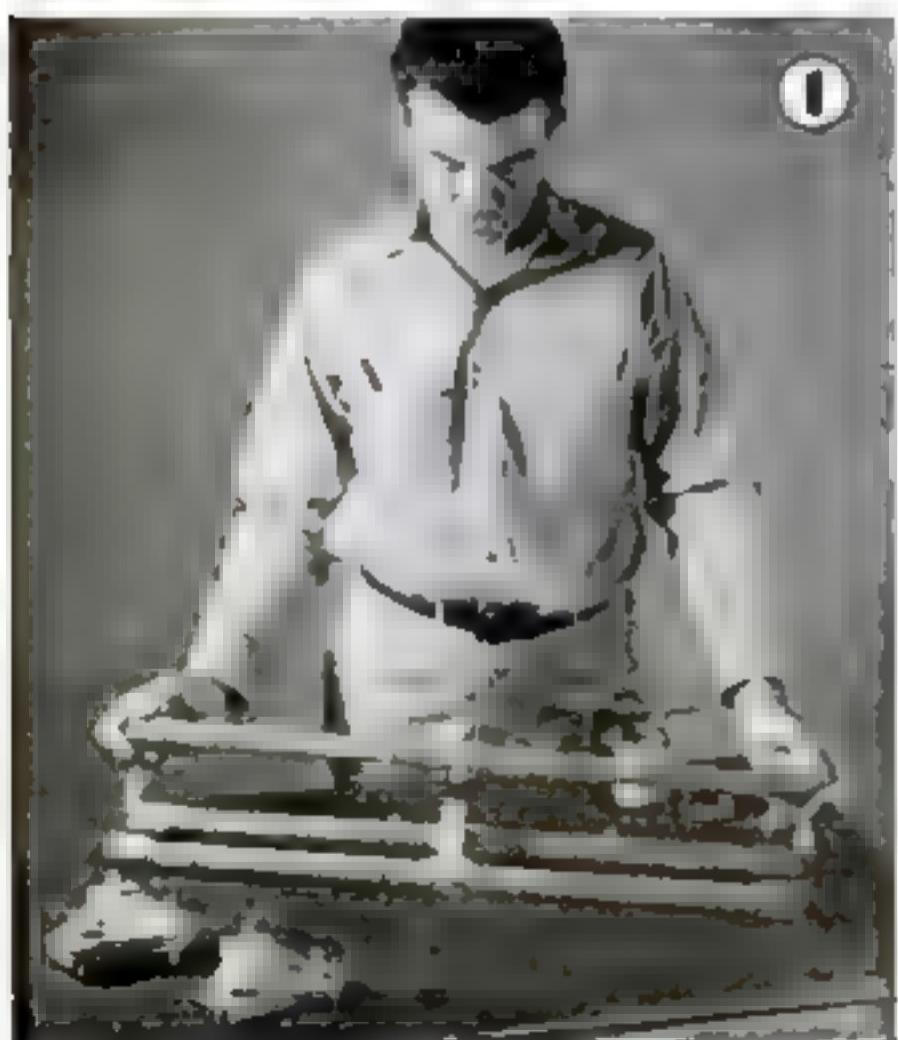

Impressions for the dowel holes in the legs and in the upper plate can then be made with dowel centers. Note that the upper plate is joined to the table top with

1 Join the columns to the center block first. The dowels in the plate in the left foreground go all the way through and join the legs and columns

2 Assemble the plates and columns with glued-in dowels and clamp the piece firmly. It is best to make up a trial assembly before applying glue

3 If the legs are fitted accurately they can be glued to the lower plate without use of clamps

4 Glue alone is sufficient to hold the segments under the top. Fit and glue each in its turn

Pedestal Stand

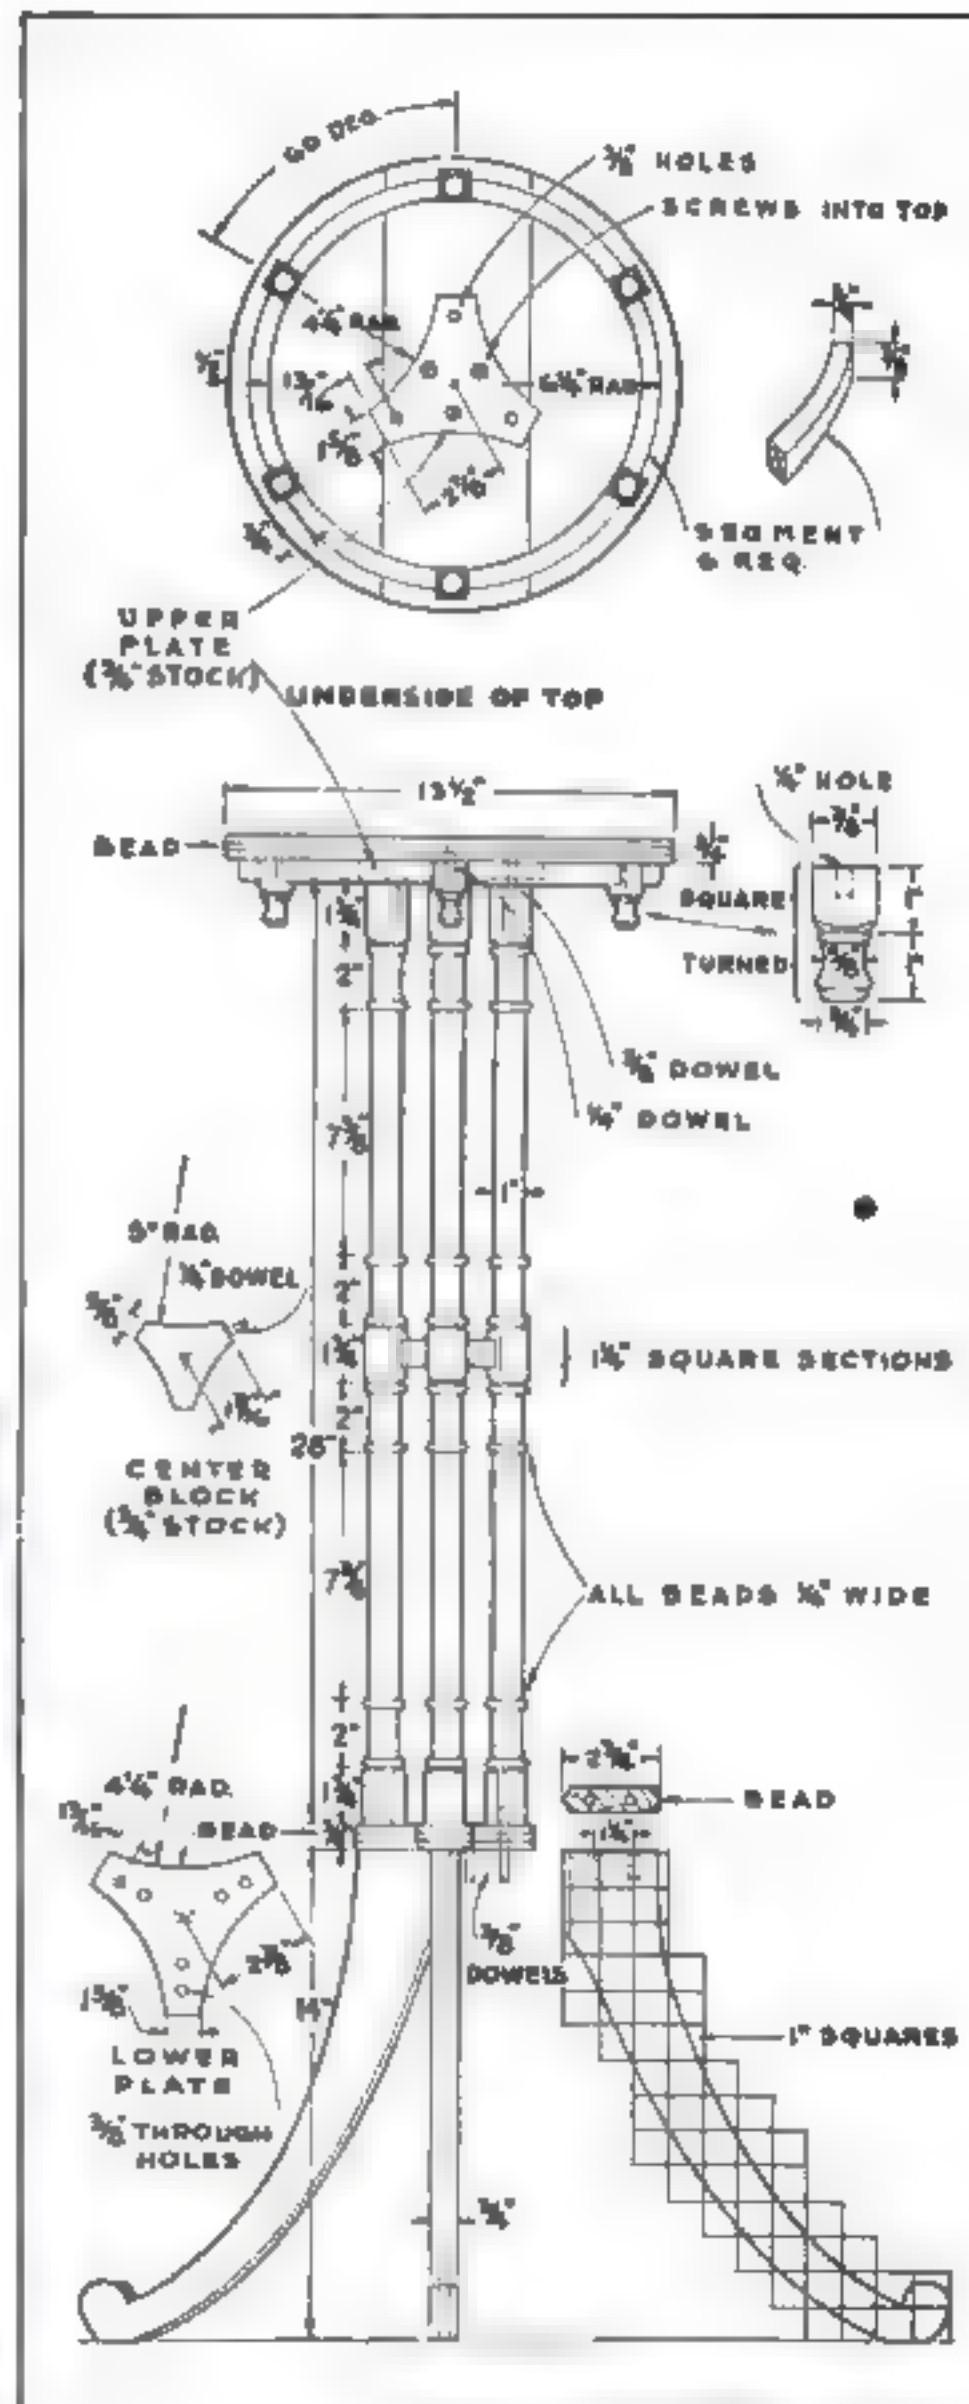

MAKE FOR THE YEARS TO COME . . .

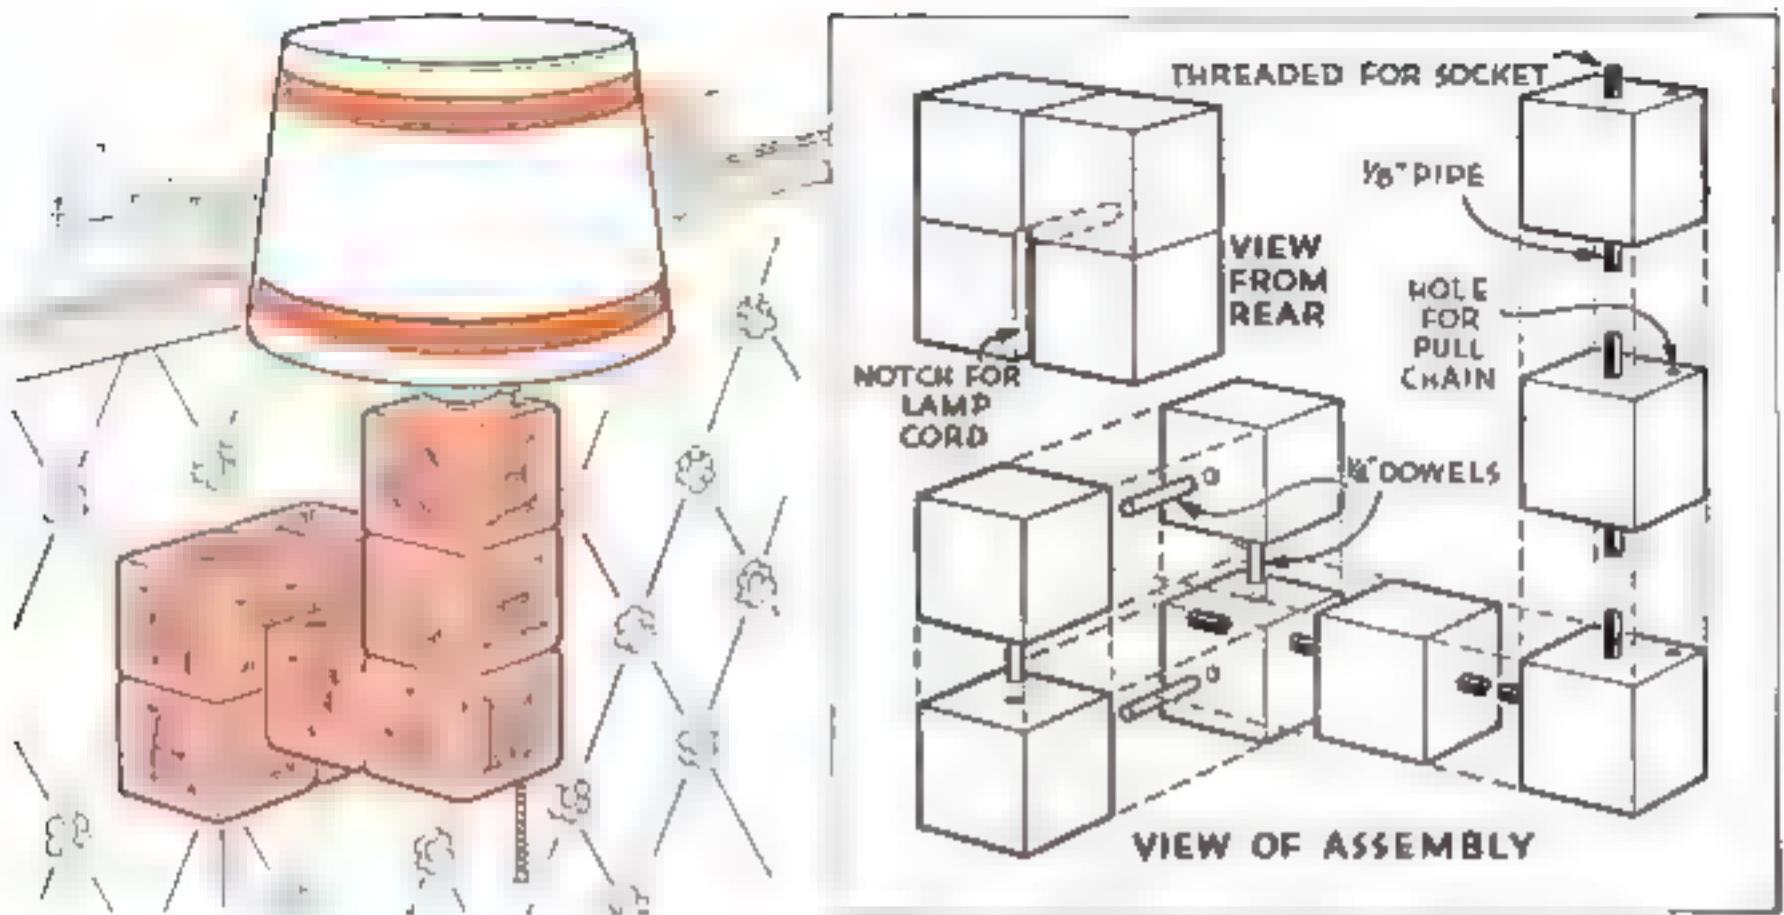

screws and that dowel holes are needed only for joining it to the columns. These holes may be just deep enough for firm joints. Bore the ends of the columns in the lathe.

A template for the center block is easily made by sandwiching a sheet of paper between the columns and the lower plate, which are assembled temporarily for this purpose. Mark lines along the inside edge of the squares and add the curves.

In laying out the plates, center block, and table top, be sure to have the grain of the stock run in the same direction for all, that is, in line with a common leg. Bore the squared ends of the center block and the center squares of the columns for dowels, and assemble these pieces first, as shown in the photos, before adding the plates and legs. Shape the legs and tabletop segments with the grain running lengthwise, bead the legs and lower plate, and build up the top from three pieces with heart and sap sides alternating to reduce warping. Ornamental turnings are fastened under the top with $\frac{1}{4}$ " dowels.

Walnut and mahogany are particularly good woods for furniture of this sort. Rub in a filler, and sand lightly after 48 hours. Use lacquer or varnish, rubbing the top to a high gloss and the rest to a semigloss.

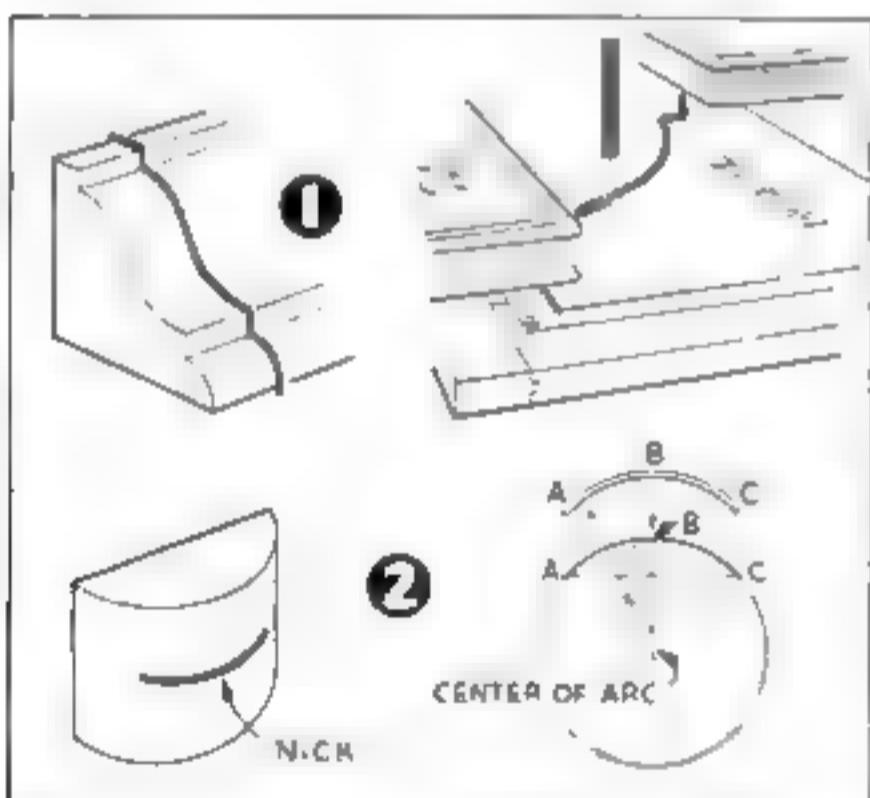

Wall Lamp of Alphabet Blocks Illuminates Child's Room

AS APPROPRIATE as it is easy to make, a wall lamp of ordinary alphabet blocks is a colorful fixture for a child's room. Bevel one edge of two of the blocks in the base to form a notch for the cord which extends to an outlet in the baseboard. Assemble the four with dowels, as shown, and when the glue has set, bore through the center of the assembly for one of the $\frac{1}{8}$ " pipes.

Bore three of the other blocks through for pipe and one halfway through from two adjacent faces. The pull-chain hole is bored while the arm is temporarily assembled.

Thread the cord as the blocks are assembled and glued. Mount the base on the wall with two screws driven through countersunk holes, and plug the holes with plastic composition wood.—PETER WINCZEK.

Solder Wire Serves as Guide for Outlines in Drafting

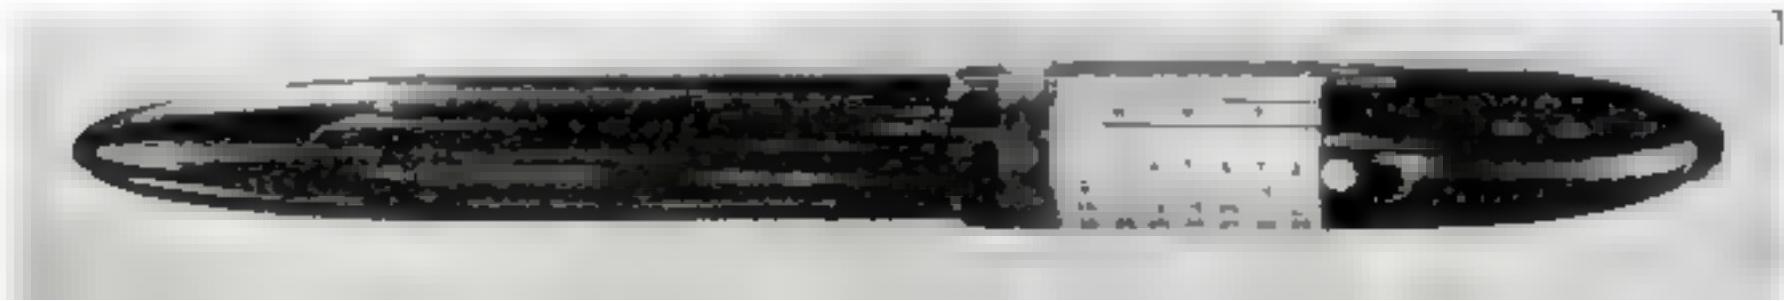

RESIN-CORE solder wire, which is pliable and yet is stiff enough to hold a shape unsupported, is a handy aid in transferring an irregular contour to drafting paper. Press the wire to the contour, as in Fig. 1, and then lay it on the paper and weight the ends. Draw the outline lightly or dot it and fill in later.

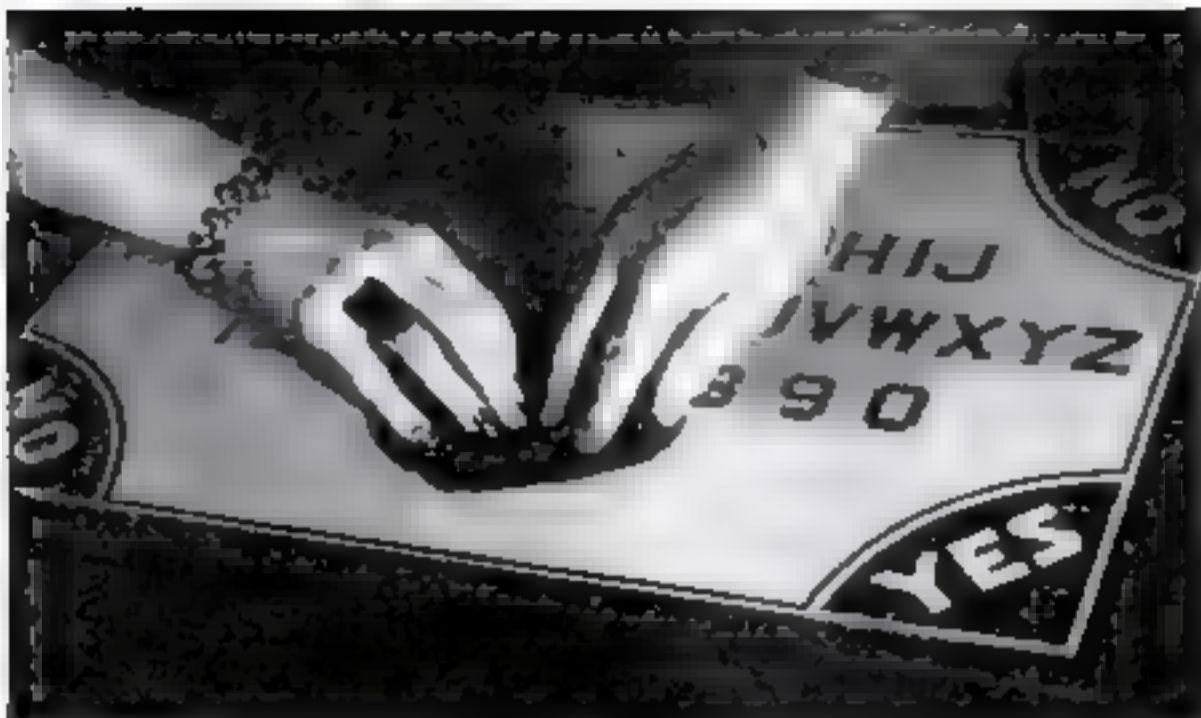

To obtain the radius of a partial sphere or cylinder, nick the center of a length of solder wire, mold it on the curve, and mark the center and ends on paper (Fig. 2). Then find the intersection of the perpendicular bisectors of two chords through the three points.—JAMES H. CARLISLE.

Calendar Mounted on Fountain-Pen Cap for Ready Reference

WHEN dates must be referred to frequently, a small calendar will be found handy if it is attached with transparent cellulose tape to the cap of a fountain pen.

One month may be mounted at a time, or a full 12-month calendar can be used, the tape removed and months peeled off as they pass, and the calendar remounted.—H. GIFFORDS.

Mystic "Spirit" Board Spells Out Messages

THE subconscious mind is said to be the guiding force behind operation of the ouija board, which is believed to have first made its appearance around the middle of the last century during a wave of spiritualism. Two persons sit beside the board, their fingers resting on a "planchette" and their arms unsupported. Soon the planchette begins to move, and eventually it comes to rest pointing at a letter on the board. Often it will spell out a word.

What really happens, according to Dr. Robert S. Woodworth, professor emeritus of psychology at Columbia University, is that muscular tension in the arms sets the planchette in motion. It may come to rest at first on any letter just by accident, or subjective expectancy on the part of one or both of the players may guide it. This first letter may then suggest a word that the players may finish spelling out without

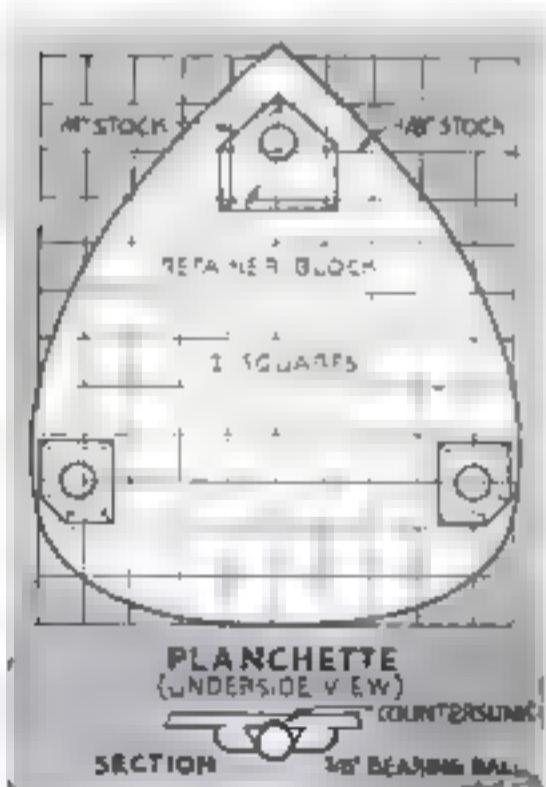

realizing that their act is subconscious. The fact that four hands apply pressure in different directions helps create the illusion of independent movement.

A simple ouija board for providing entertainment at parties can be made from a 16" by 24" sheet of stiff cardboard lettered on $\frac{1}{4}$ " squares as shown in the drawing, or you can use plywood of the same size. Letter cardboard with India ink for a black-and-white finish, or use show-card colors having a sharp contrast; then apply a coat of clear lacquer or varnish to both sides. Be sure to put the

coat on both sides so the cardboard won't curl. If you use plywood, sand it lightly, use oil paints, and finish with lacquer or varnish. Avoid water stains that may raise the grain and spoil the smoothness essential for easy movement of the planchette.

This planchette, or pointer, is made of wood or pressed composition board, as indicated in the drawing. The retainer blocks, which act as bearings for the steel balls, should be hardwood. A countersunk hole in the board over each ball helps to make movement smoother.

In using a ouija board, the two players put both hands on the planchette and wait for muscular tension to cause it to move. Sometimes, in the midst of a semigerous session, laughter can be provoked if you are skillful enough to guide your partner's hand to letters that provide a comical answer to some spoken question.

Beverage Server

Guests will find it hard to believe that you could make such an attractive beverage server merely from scraps and a piece of broom handle. Recesses like those to hold the glasses usually require routing, but by making the tray section in two parts, you can cut them with a simple saw

1 Lay out a pattern for the tray first, using one of the glasses it will hold. Cross three lines at equal angles for a six-glass tray, place a glass upside down $\frac{1}{4}$ " from adjacent lines, and draw a circle around the glass. Draw a central circle just touching the first one

2 Use the glass again, and draw rings tangent to the central circle and $\frac{1}{2}$ " apart. Locate the centers of these rings with a disk or a segment of the same radius, and from these centers draw arcs on a radius $\frac{1}{2}$ " larger than that of the rings. A compass will be needed

3 Nail together near the corners two squares of wood, one $\frac{1}{4}$ " thick and the other about $\frac{1}{2}$ ". Transfer the design to the thin piece, using carbon and taking care to locate the center. Drive nails lightly in two or more rings so the pieces won't part as the outline is cut

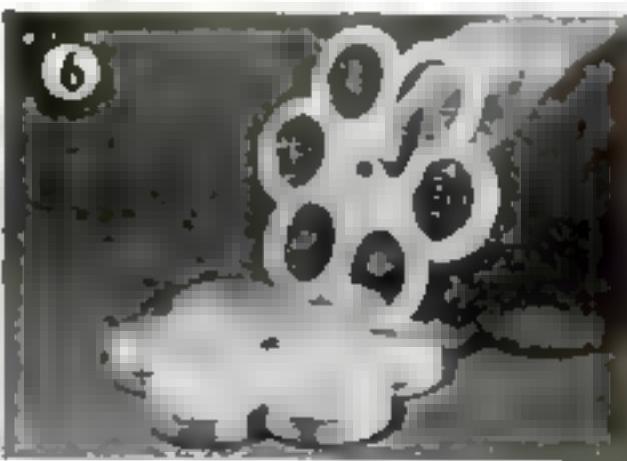

4 Bore a hole at the center for a tight fit for the broomstick or a length of dowel. This should be perpendicular to the surface of the tray, so nail a right triangle of wood lightly to the stock to act as a guide for the bit

5 Using a coping saw, cut the outline through both pieces of stock at the same time. A convenient way to do this is to clamp the work firmly to a table or bench, leaving the part you are cutting projecting over the edge

Separate the two pieces after marking an edge so they can be aligned again, and saw out the circles in the thin section. Start the coping saw through a drilled hole, clamping the piece as before and moving it when necessary

Anyone can make this attractive and useful home accessory from scrap pieces of wood with the simplest of ordinary hand tools.

By CHARLES and BERTRAM BROWNOLD

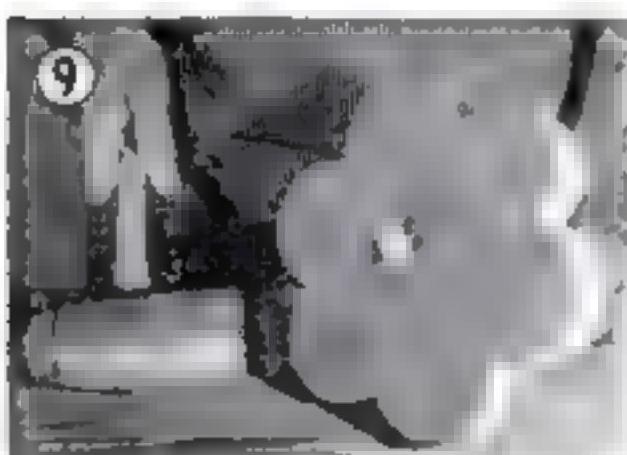

Glue the two sections together, using clamps for pressure and being sure to align the marks at the edge so any slight irregularities in sawing will match. Let the glue dry; then round the edges with a strip of sandpaper

Cut a length of broom handle or dowel a little less than twice the height of the glasses to be used. Square one end, make a saw cut in it, and shape a wedge to fit the saw cut. Round off the other end of the handle slightly

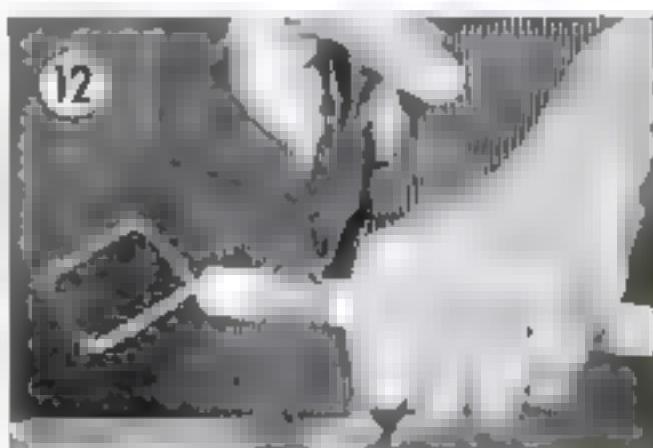

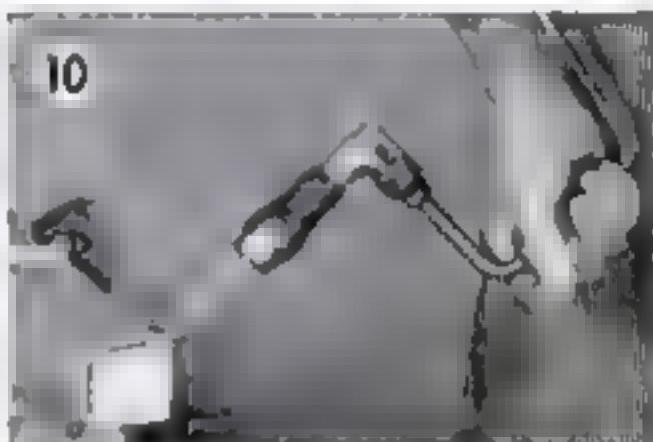

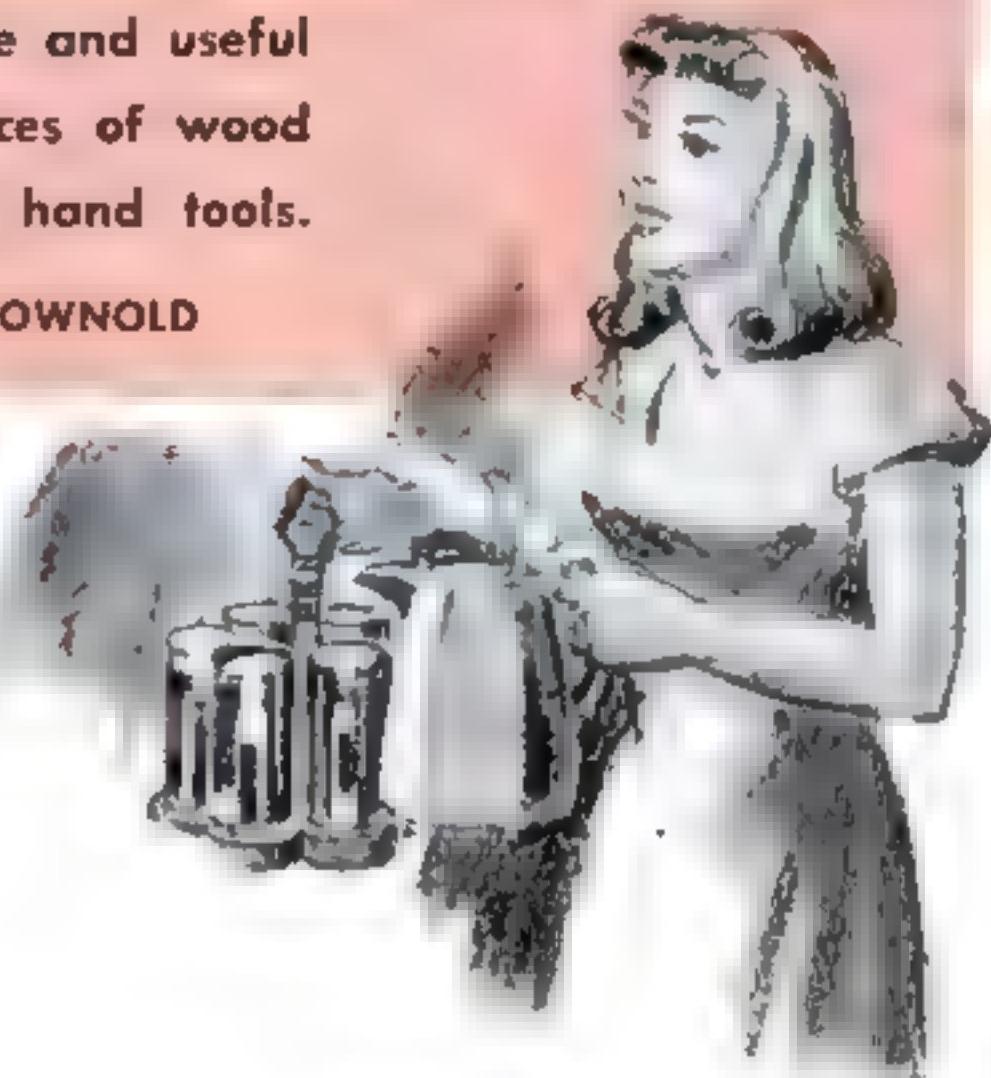

Glue the broomstick into the hole in the tray, drive in the wooden wedge, and when the glue has dried, cut off any of the wedge that protrudes. Sand the bottom smooth. Then paint, stain, or varnish the entire piece as desired

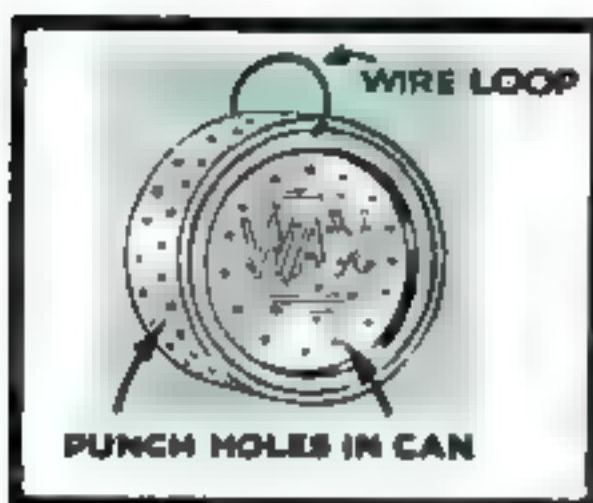

Coathanger or heavier wire will make a good handle. Shape it by bending it around the square part of a piece of 2" by 2" stock and twisting the ends in a hand brace. Start the twist at the ends and work toward the wood. The ends can then be soldered if necessary

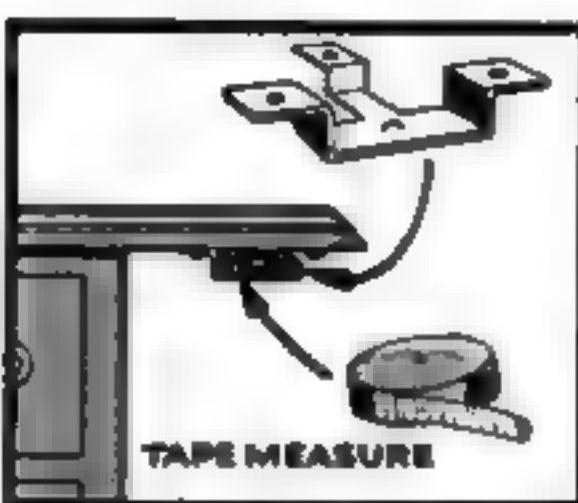

Lay the square of wire on a metal surface or a stone and hammer for an attractive finish. Drill a deep undersize hole in the top of the broomstick and force the wire in, twisting as you would a screw to help form threads. Cement in the hole may help to hold the wire

For added decoration, hammer another length of wire and coil it on the upper part of the handle. Tuck the two ends in holes drilled to receive them. Coat both wires with clear lacquer to keep them from rusting. The tray should then be touched up if it is necessary

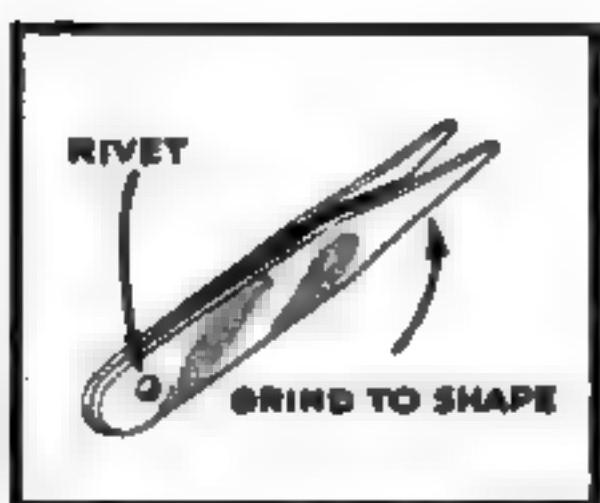

Empty was cans, punched full of holes, are handy as containers for hanging moth balls in closets

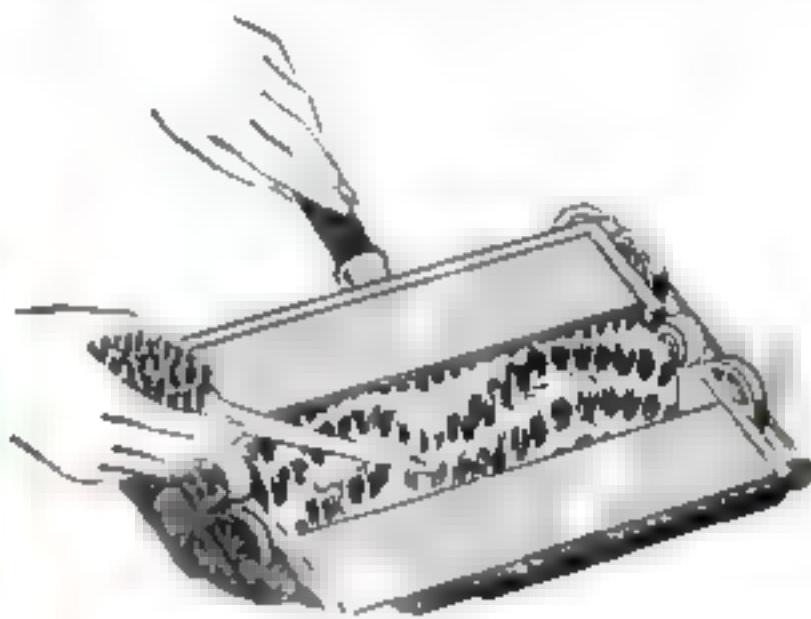

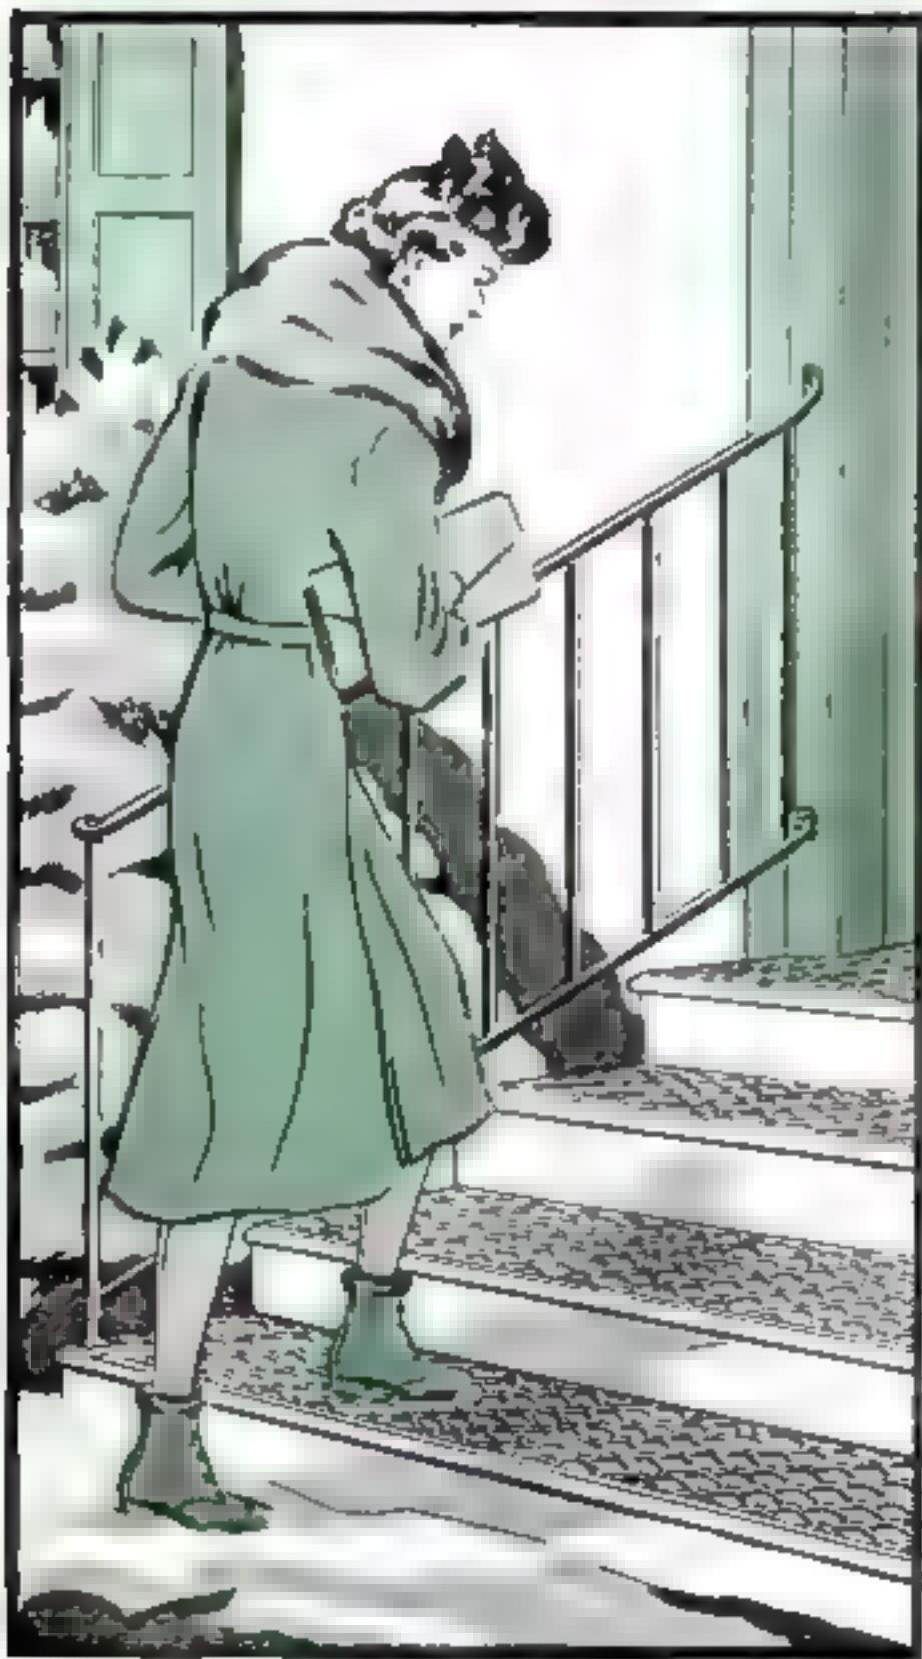

A tape-measure rack of tin-can stock or thin strap iron is a convenience on a sewing machine

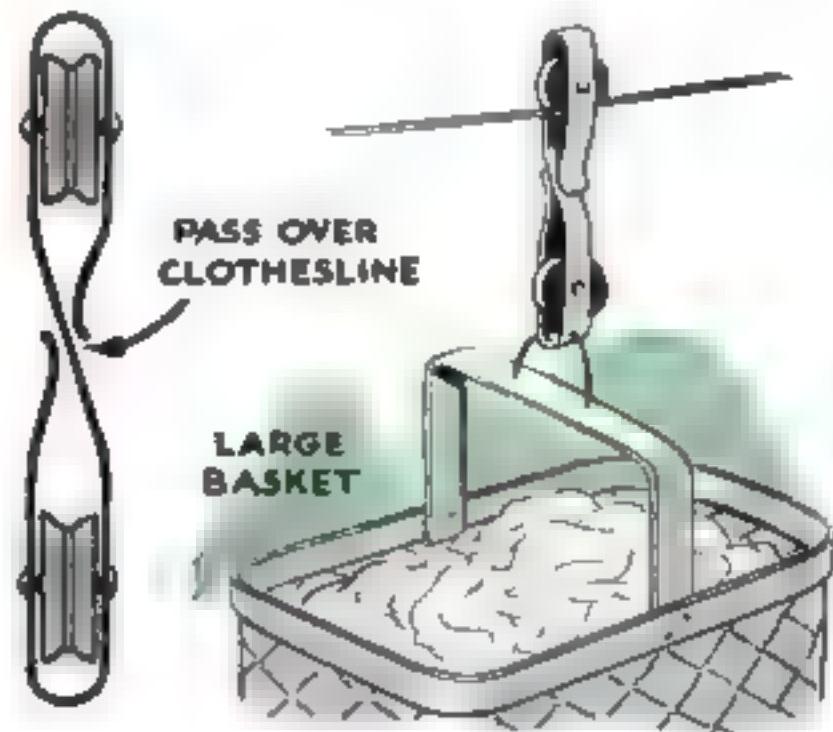

Two pieces of old hacksaw blades ground, riveted at one end, and sprung apart, make good tweezers

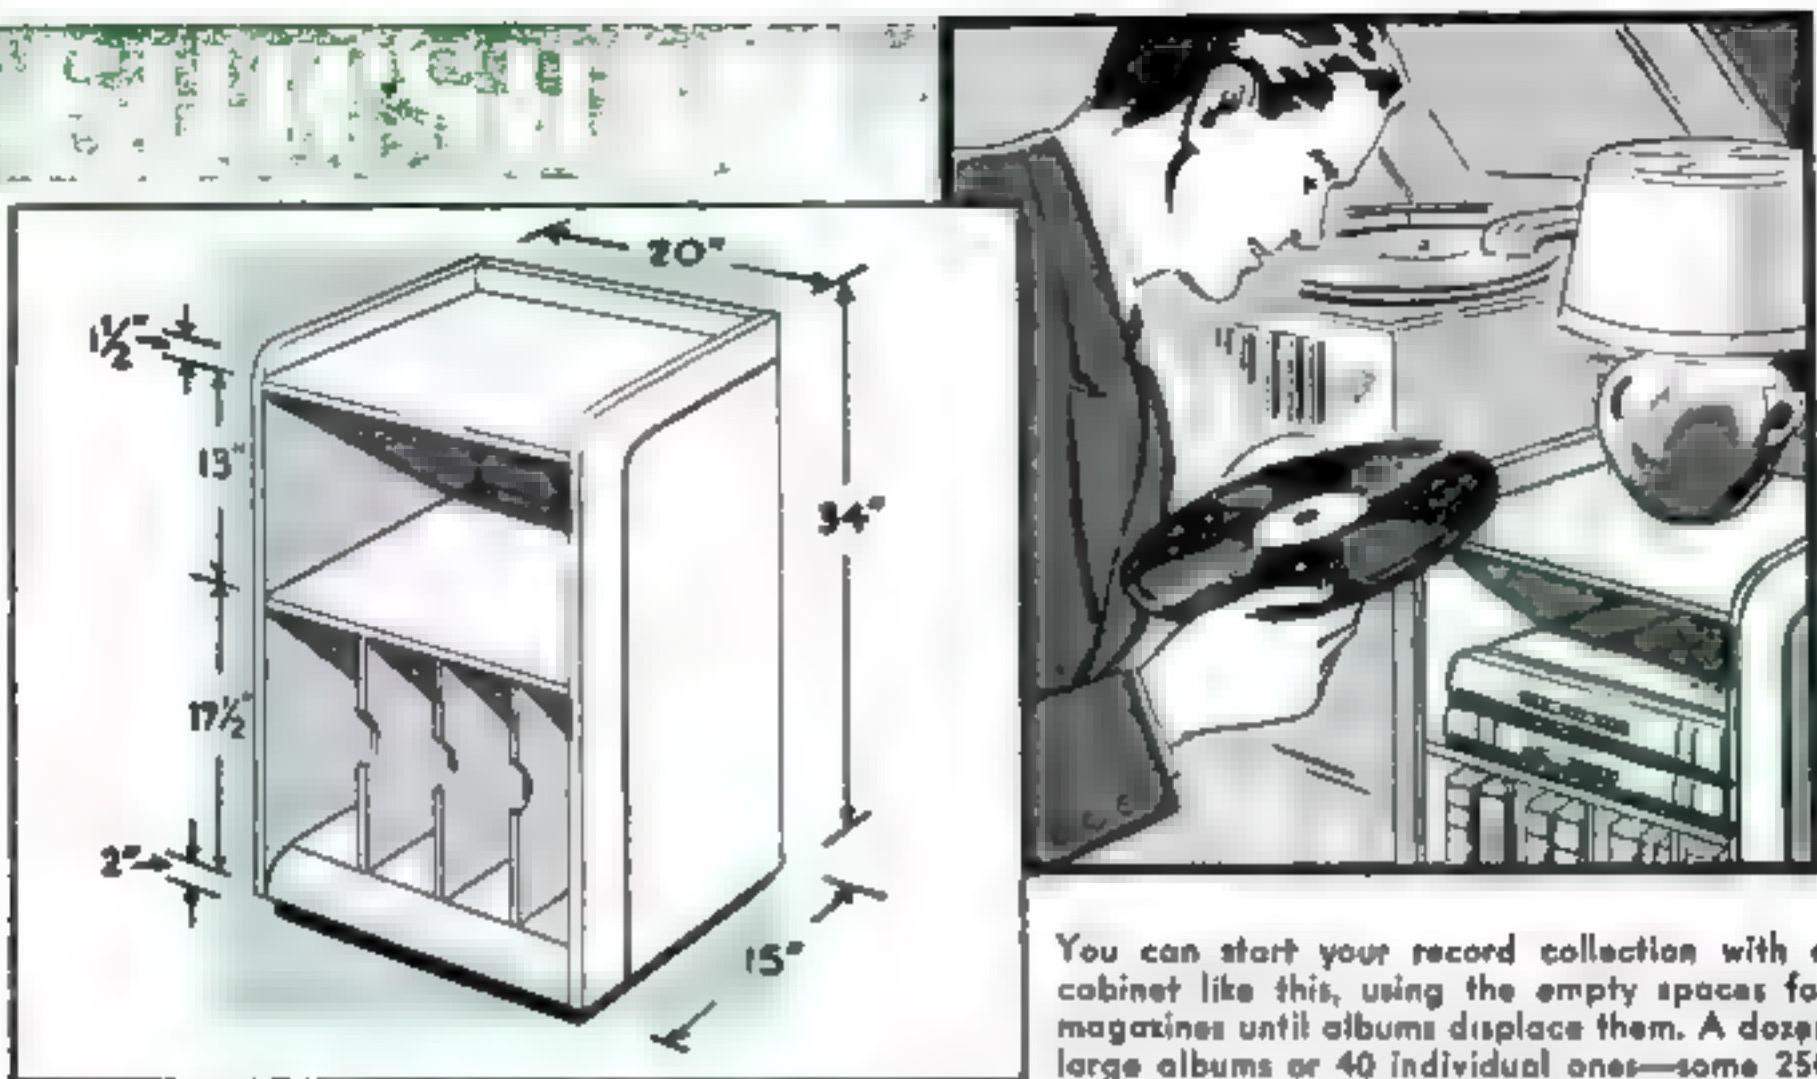

Wire-type lath, cut to fit on your entrance stairs, will serve as safety treads during a snow or icy weather. Hold them with small staples at the ends, or at front so the backs can be raised for sweeping

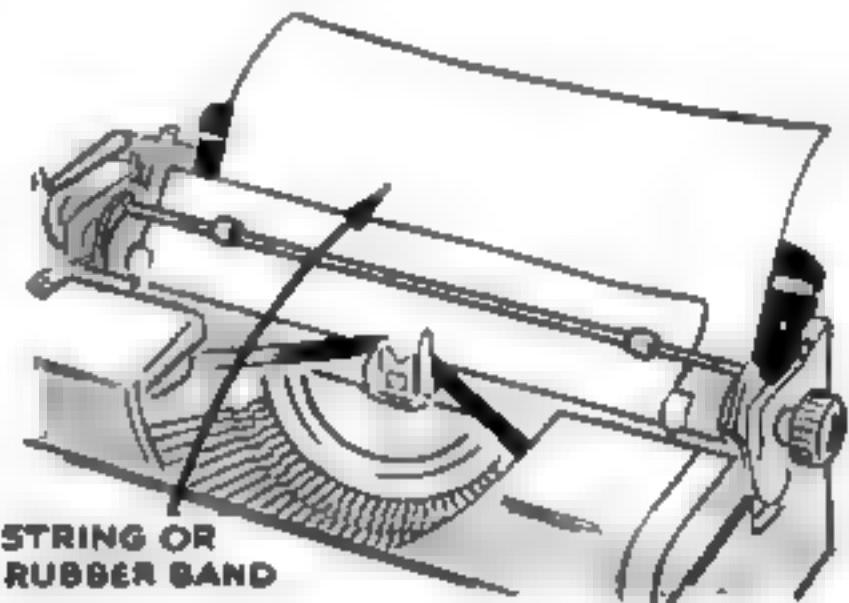

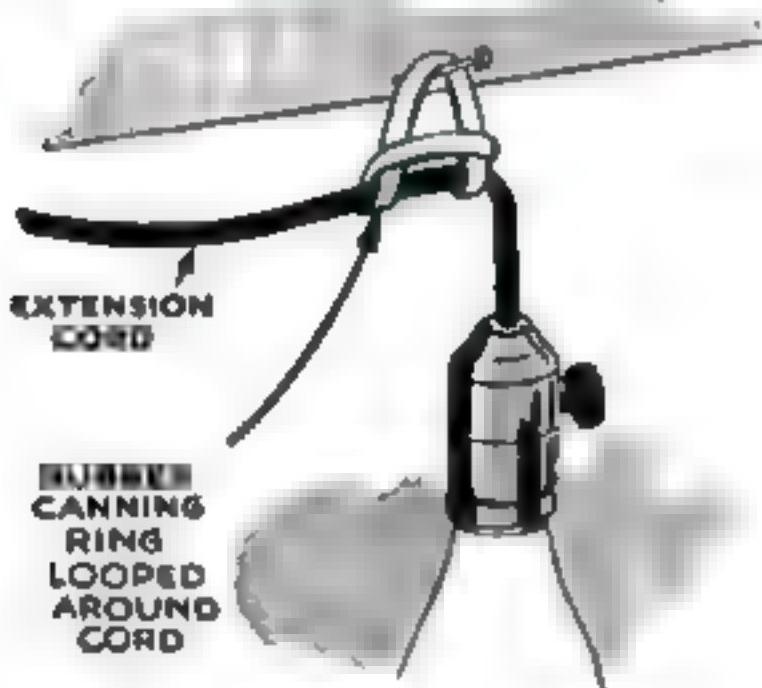

Use the handle of a ratty brush or comb, or a handle whittled to a point, to take strings off carpet-sweeper rollers. The brush removes lint

Slipped on a fixed or double-pulley clothesline, a line separator will hold a big market basket of wet wash. It can be slid along a fixed line or kept stationary on a line working on pulleys

You can start your record collection with a cabinet like this, using the empty spaces for magazines until albums displace them. A dozen large albums or 40 individual ones—some 250 records—can be accommodated. Finish with a good enamel. Note the recessed pedestal base

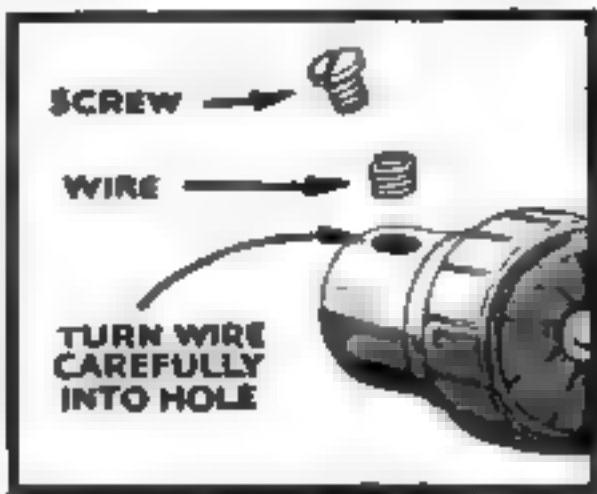

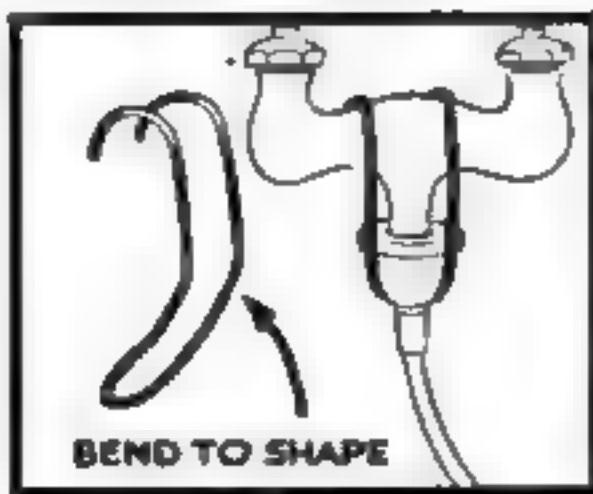

When you next need to hang an extension cord on a nail to light a dark corner, try looping a rubber canning ring on it to keep the cord from slipping

If the bottom half of a sheet of paper blows over your typewriter keys, anchor it with a rubber band attached as shown and insert the paper behind it

Waxed paper as a bushing on a pipe stem will not swell and split a shank. It lubricates so the stem may be pulled out

Clothes-hanger wire, bent as shown below, will keep water pressure from forcing your shower-hose coupling off the bathtub faucet

Wind a fine wire onto a screw that won't hold in a plastic knob. Carefully unscrew the coil, turn it into the hole, and insert screw

Meet EDWIN M. LOVE

FOR more than 10 years Edwin M. Love has been writing "how-to-make" articles. In his own words, "With the exception of time out for occasional excursions into writing and illustrating children's books (not all of which have been published!) and, recently, a tour of duty in a defense plant, preparing these articles has been a full-time job and hobby rolled into one. However, on the rather rare occasions when I have a little time to myself, I dabble in the field of good music."

Mr. Love lives in Pomona, Calif. He has made a specialty of woodworking projects—furniture, models, novelties, and the like. He is particularly interested in describing new shop methods. Jigs and forms, he feels, should be adaptable and permanently useful. Such articles as the one below illustrate his point. Here you will find jigs that are well worth the time spent in making them because they will prove useful over and over again.

Jigs Speed Reconditioning of Circular Saws

By EDWIN M. LOVE

USE of a file in the jigsaw takes the guesswork out of sharpening combination and planer saw blades. A jig for this purpose is not difficult to build, and it can be used time and again.

The jig is not foolproof. Use of it to good advantage does require judgment, but it can hardly be said to call for a great amount of skill. With it the novice can do excellent work. The hook and bevel angles of the saw teeth will not vary after sharpening, and uniform tooth length will be the rule.

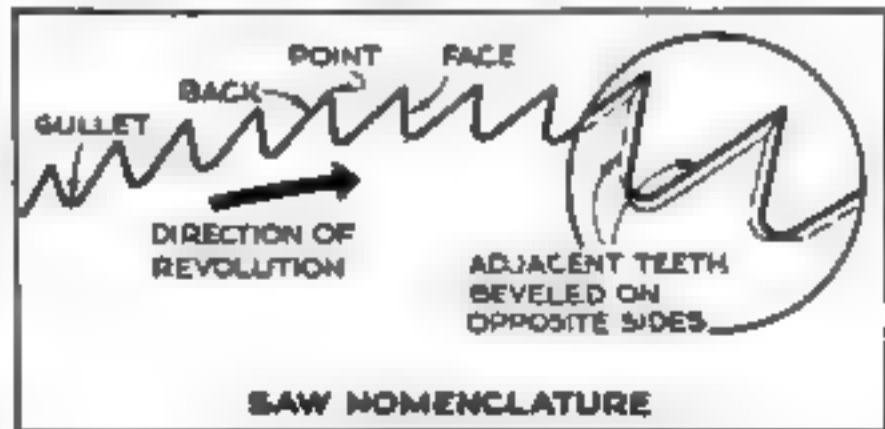

About the only pitfall to be watched for is the chance of filing the teeth on one side of the saw blade shorter than those on the other; but tooth shape and spacing will be much more nearly perfect than is the case when sharpening is done by hand filing.

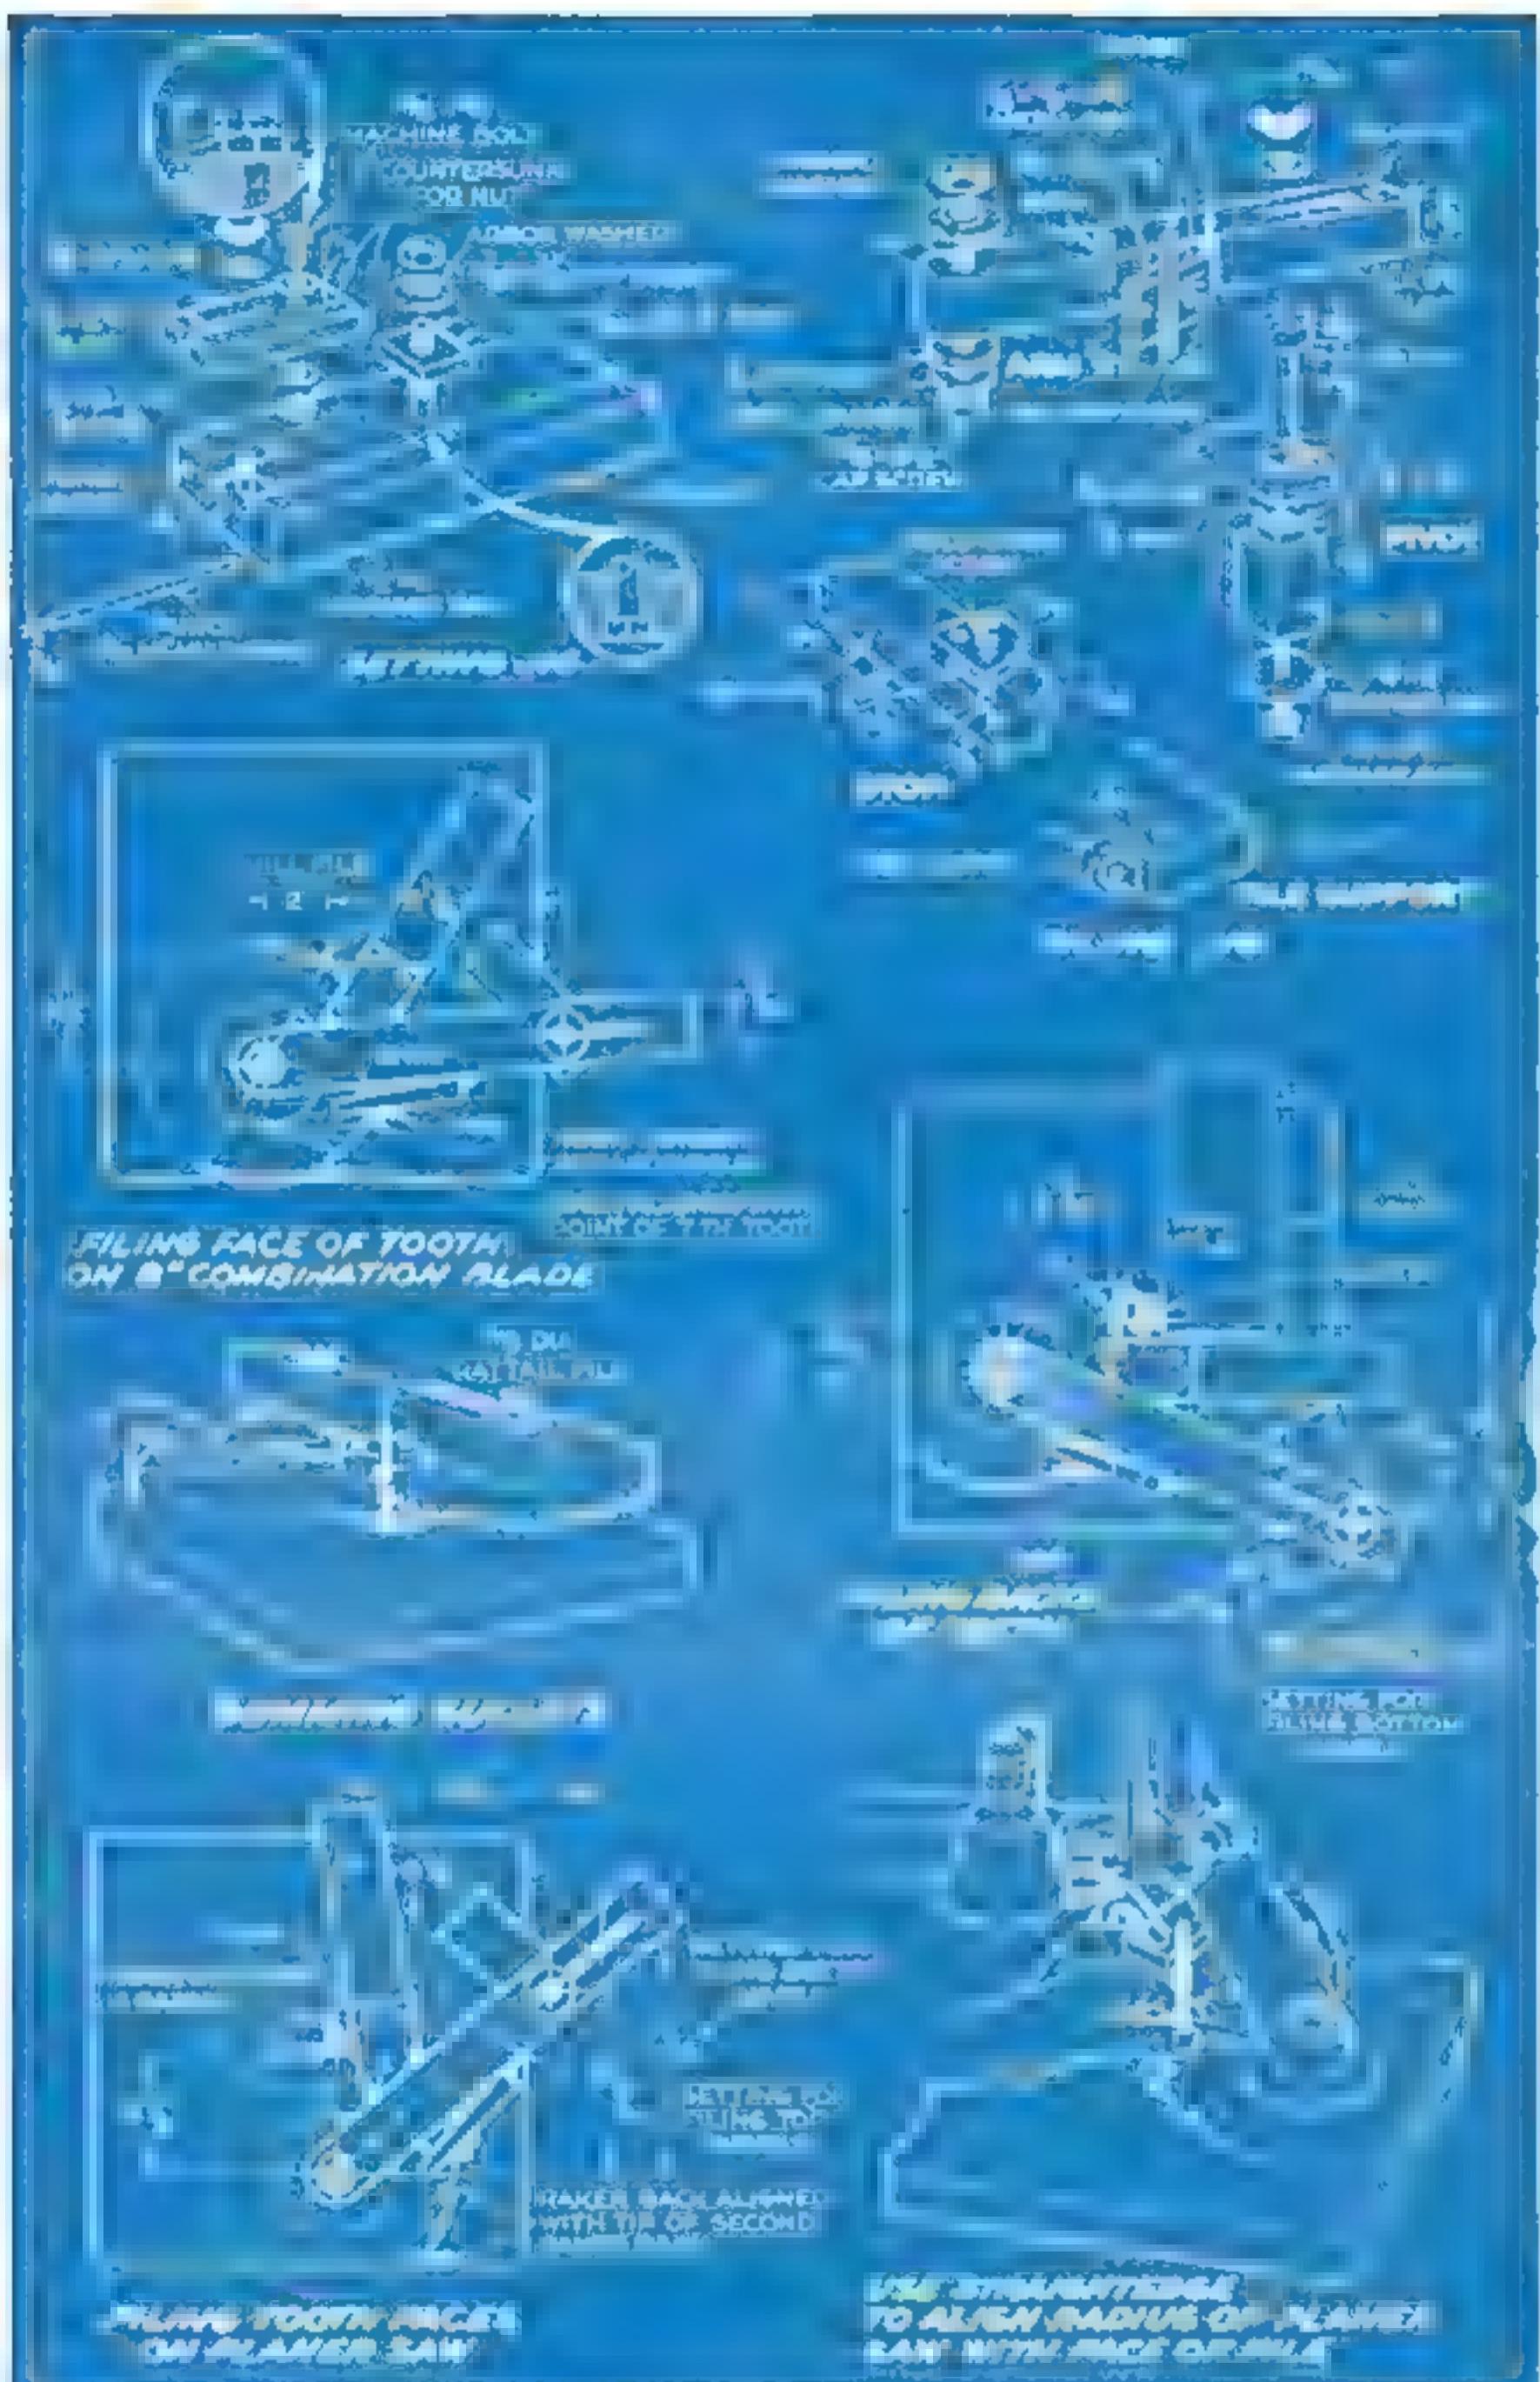

Jointing of a blade is not absolutely necessary every time the teeth are sharpened, but it is useful for matching the lengths of teeth when alternate teeth are filed and a change of setup is required. Setting is necessary for flat blades but not for hollow-ground blades.

How is a blade jointed? Mount it back-

wards on the saw arbor with the maker's trade-mark uppermost when the nut is tightened. Remounted the same way after having been sharpened, the blade will be concentric with the arbor even in cases where the arbor hole is oversize. Raise the table until the teeth barely rub an oilstone rested on the table above the blade opening, and run the saw for a few seconds. Examine the teeth to see that a small, bright flat spot or "shiner" appears at each point. If this shiner does not show on every point, start up the saw again and hold the oilstone to the teeth for a few more seconds.

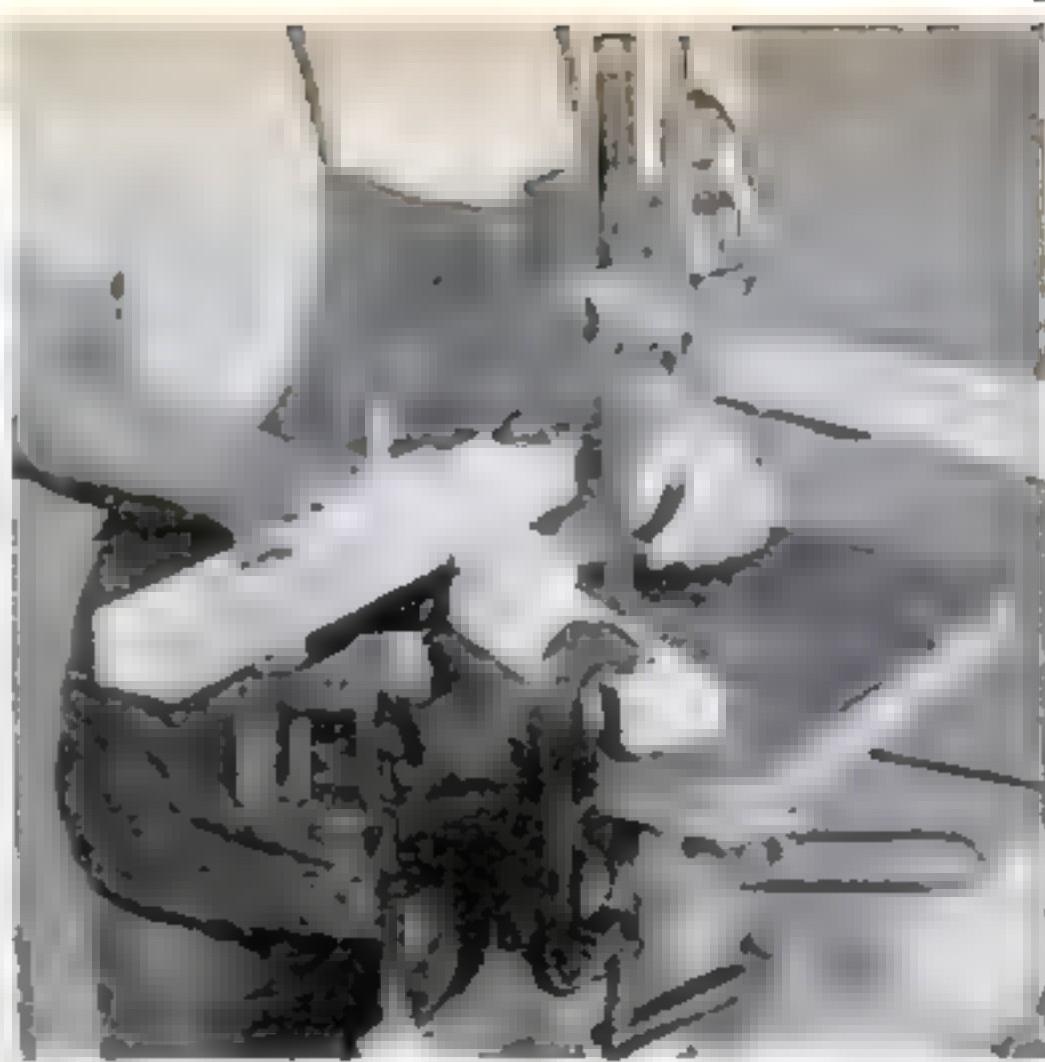

Is setting difficult? Not with the jig illustrated. The drawing on the facing page shows its construction. To use it place a

Setting the teeth of a circular-saw blade is simple with a jig like this. Set alternate teeth to one side; then turn the blade over

In filing the face of the teeth, go around the blade two or three times with very light cuts if the teeth appear to be irregular. This tends to space them more evenly

wooden shim of proper thickness on the arbor cap screw, which should be of the same diameter as the saw arbor; slip on the blade and nut, and rotate a downward-set tooth over the stake. Adjust the stake to set the tooth for a distance of $\frac{1}{8}$ " from the point, and set with a light hammer blow. Skip the next tooth and set the second, and so on. Then turn the blade over and set the remaining teeth.

What is the filing jig? Its construction is also shown in a drawing. The arm is slotted at one end for adjustment on the pivot, and on one side it has a hinged and tapered leaf carrying a metal dog. For a pivot bearing a block is tenoned to glue into a horizontal block which is used in clamping the bearing to the table. A through bolt holds the bearing together and secures the pivot to the arm. Forward motion of the arm is limited by a stop block.

How is a combination blade sharpened? To file the faces of the teeth, level the jigsaw table and insert a round-edge mill file in the chuck. A mill file with a square edge can be used if one with a round edge is not available. Set one side square with the front edge of the table.

Mount the blade under the jig arm, clamp the arm to the table, place the stop against it, and turn the hold-down screw on the stop to make contact with the blade. Turn the blade until the face of a tooth bears against the file, open the dog leaf until the dog also touches the face of a tooth, and turn in a wood screw against the edge of the dog for its stop. Then close the leaf slightly, bracing it with a shim, and start up the jigsaw.

Feed the tooth against the file by rotating

the blade counterclockwise while holding the arm against its stop. Remove enough metal to true the tooth and to cut the shiner in half. Once the amount of filing is established, draw the arm back and swing the dog out. Rotate to the next tooth, close the dog, and file again. When all the faces have been filed, set up for filing the backs.

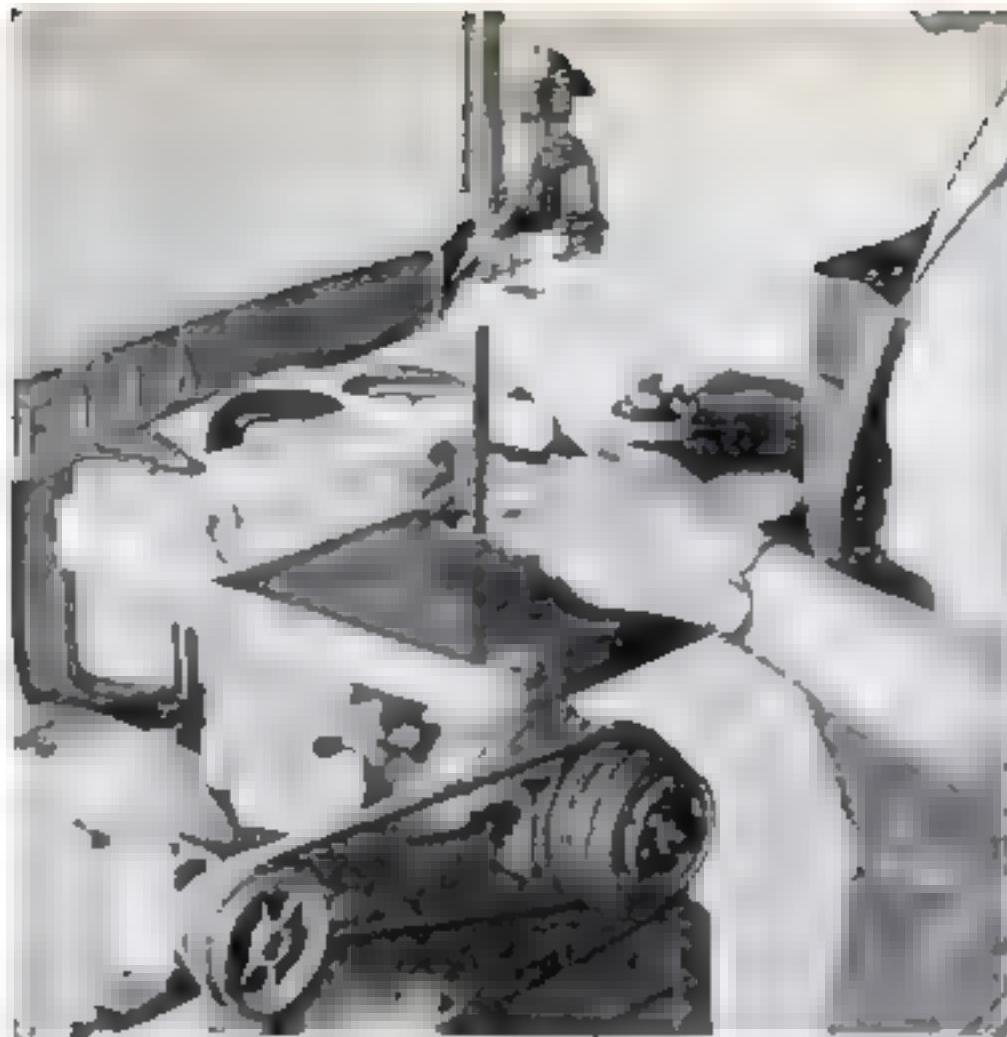

Dimensions for a typical setup are given in the drawing, but they are simply for use as a guide. One easy way to get the hook of a tooth right is to remember that it is usually tangent to a circle half the diameter of the blade. If the blade is positioned with about $\frac{1}{8}$ " of a round-edge file making contact with the face of a tooth, the setup will be correct. There is little spring to the file, and for this reason filing should be continued until cutting stops.

When are gullets gummed? This is done next. Clean out the gullets with a 4" rat-tail file, keeping them tangent with the faces of the teeth.

What is the setup for filing backs? Tilt the table 5 deg., and fit the back of the tooth to the opposite side of the file, noting that on most combination saw blades the back of each tooth is aligned with the tip of the seventh tooth behind it. Then, as before, set the metal dog to engage the face of a tooth.

A tooth set upward is beveled on the underside, while one set downward is beveled on top. File alternate teeth. Then draw back the arm of the jig, tilt the table 5 deg. in the opposite direction, reset the arm to bring the file in position, and continue.

How is a planer saw filed? The round-edge mill file is also used for this job. Set

Tilt the table in one direction to bevel the backs of alternate teeth and in the other to finish the job. A caster behind the file will keep it from springing

Sharpen the faces of crosscut teeth on a planer blade with a three-cornered file, giving them a radial hook. The jigsaw table is tilted 18 deg.

up the jig and blade for filing the raker teeth at the backs in the same way as was done for filing the backs on the combination blade. But for a planer blade, the table is kept level. File all rakers in one setting, making them from $1/64"$ to $1/32"$ shorter than the crosscut teeth. If gumming the gullets is necessary, it is done in the same way as that described for combination saw blades. You will notice that the raker hook of most planer blades is usually slightly less than that of a combination blade.

To file the faces, replace the round-edge file with a three-cornered file having faces

$5/16"$ or more wide, and tilt the table 18 deg. File the faces of the crosscut teeth with a radial hook, tilting the table to the left for one set of alternate teeth and to the right for the other.

Does the grind make a difference? Whether the saw blade is hollow ground or flat makes no difference in filing the teeth. Where treatment does differ is in setting. Flat-ground blades require setting to provide clearance for the blade during cutting. But hollow-ground blades are usually designed so that the clearance is ample and no setting is ever required.

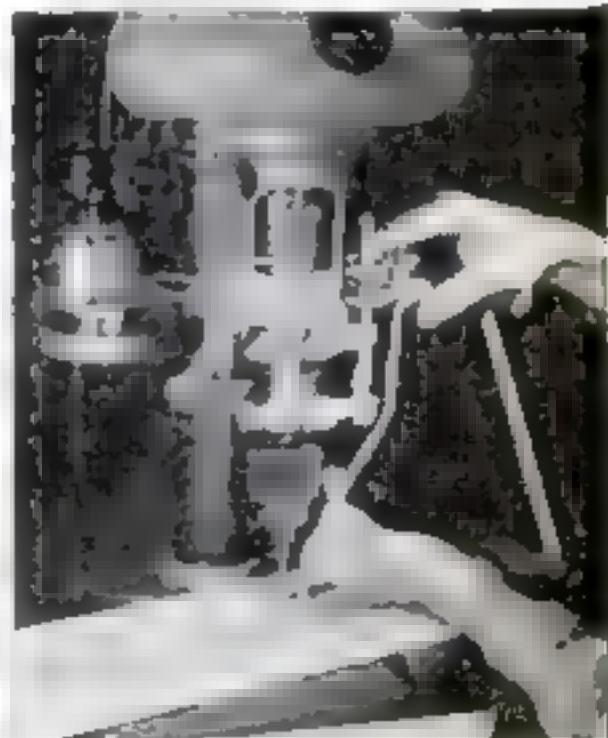

Stop Insures Drilling Uniform Depth in Work of Any Thickness

OCCASIONALLY holes must be drilled to the same depth in several pieces of stock that vary in thickness. The conventional drill-press depth stop is useless in this case because it gauges depth above the table and not from the work surface.

A suitable stop consists of a rod clamped between the nuts on the regular stop so that its end touches the work when the desired depth is reached. Thread a $\frac{1}{4}"$ or $\frac{5}{16}"$ rod about 12" long for 2" from one end and bend it to the necessary offset. Make a flat bracket from a piece of metal about $\frac{1}{8}"$ by $1"$ by $2\frac{1}{4}"$, cutting a slot in one end so that it may be slipped on the threaded upright of the regular stop. Drill a hole near the other end for the stop rod and mount this

with a nut and washer beneath and a wing nut with a second washer above the bracket. Make sure that the rod clears the chuck.

Adjust the bracket midway on the threaded portion except when it is necessary to use the full feed capacity of the press—F. H.

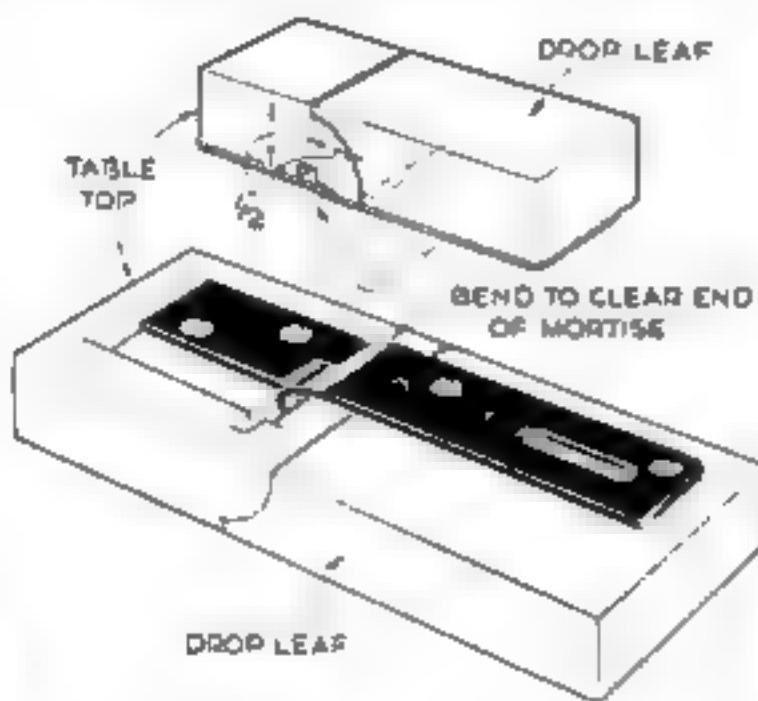

CAN you spot five errors here in sharpening tools?

1. Removing a wire edge from a plane iron.
2. Filing an auger bit.
3. Filing a chisel.
4. Grinding a twist drill.
5. Turning a scraper edge with a large nail.

ANSWERS: 1. Hold a plane iron flat on the stone when the bevel is up.
2. File auger-bit edges on the inside so as not to reduce the diameter.
3. Good chisels are hard to file. Grind and whet them.
4. If ground as shown, a drill would receive a bevel on one cutting lip, which would prevent it from cutting. The proper way is to grind back off and up to the cutting lip. Threaded drill grinding is difficult at best.
5. Use only tempered and polished steel to turn the edge of a scraper.

HINGING A RULE JOINT

[WOODWORKING]

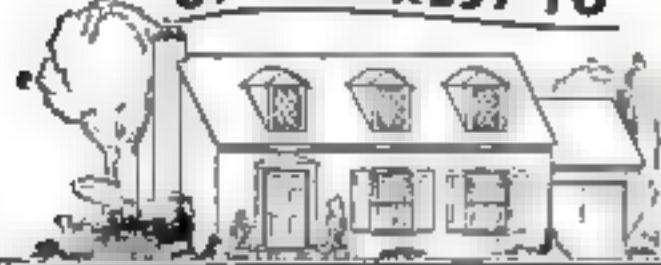

Rule joints such as those used on drop-leaf tables require hinges having one flap longer than the other and the hinges must be installed so the pins will be on the same center as the curve of the molding. Ordinary hinge bars are ideal for the purpose. Drill screw holes in the long flaps and counterbore them from the back.

Gauge lines on the underside of the table top $1\frac{1}{2}$ " from the edge of the molding to locate the hinge pin centers, and mortise slots for the hinge joints either by routing or chiseling. The usual radius of such moldings is $1\frac{1}{2}$ " on a $\frac{3}{4}$ " thick table top. If it should be greater or smaller, the gauged lines for the hinge-pin centers should, of course, be changed to correspond.

Now, by routing, or with a circular saw using a dado head or a molding head equipped with flat knives, make a stopped mortise to receive the short flap of the hinge. The depth of the mortise must be such as to center the hinge pin $\frac{1}{2}$ " from the top of the quarter-round portion of the molding. Stop the mortise as shown and bend the long flap of the hinge in a vice to clear the closed end of the mortise; then screw the long flap to the table leaf without mortising. Insert heavy paper in the joint when assembling in order to gauge clearance; otherwise rubbing will wear the finish.

If preferred, the hinge mortises in the table top can be extended to the edge and the long flaps then mortised into the drop leaves without bending. The ends of such top mortises will show however if the lowered table leaf is swung out of plumb.

OF INTEREST TO

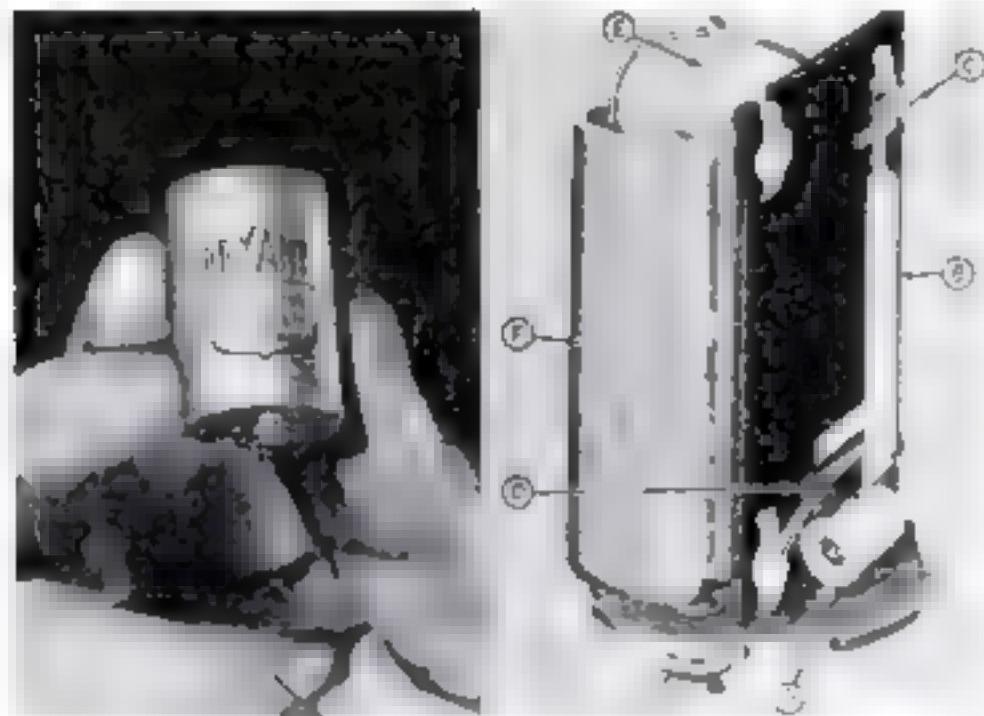

HOME OWNERS

WALLPAPER REMOVAL is speeded when the old paper is thoroughly soaked by a new sprayer that is attached to the garden hose in place of the regular nozzle. The sprayer is held about 15" from the wall and moved slowly to allow the mist to soak in. It is made by the Mistic Manufacturing Company, of Cincinnati, Ohio.

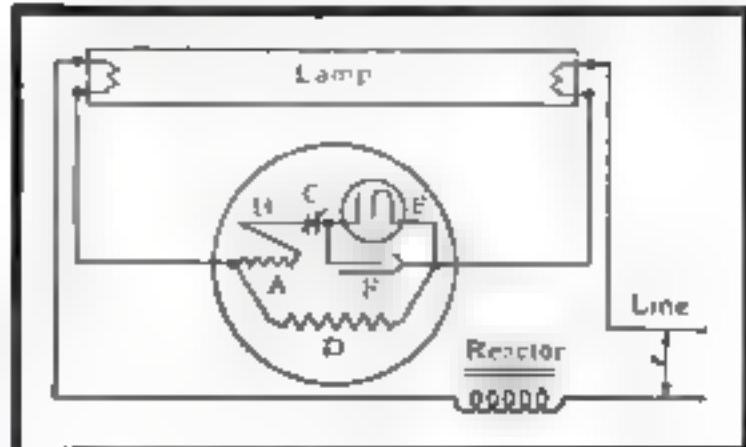

FLICKERING of old fluorescent tubes is stopped by an automatic switch that has been incorporated in a new type of starter. This eliminates the blinking that is common in tubes that have become deactivated and are at the end of their useful life. The automatic switch built into the no-blink starter mechanism shuts off the current, just as the filament breaks in an old incandescent lamp, and the light ceases abruptly instead of flickering annoyingly.

THESE NEW DUSTPANS are molded of brightly colored cellulose acetate plastic with a pliable front rim that shapes itself automatically to the contour of an irregular floor. They are rustproof and won't chip or crack, and the color is nonfading, according to the manufacturers, Plastic Molded Products, Inc., of Los Angeles.

New elements in the starter are the resistors and a bimetal switch shown at *A*, *B*, *C* and *D* in the cutaway drawing and the wiring diagram reproduced here through the courtesy of the Westinghouse Engineer. When the lamp is functioning normally, current flows through the starter mechanism only long enough for the original units *E* and *F* to strike the arc through the mercury vapor. But should the lamp fail to light, the current flowing repeatedly through the resistance *B* heats bimetal switch *C*, opening the circuit. A minute current through resistor *D* keeps *C* open until a new tube is installed.

Resistors and a bimetal switch in this fluorescent-lamp starter will shut off current when the tube fails to start readily

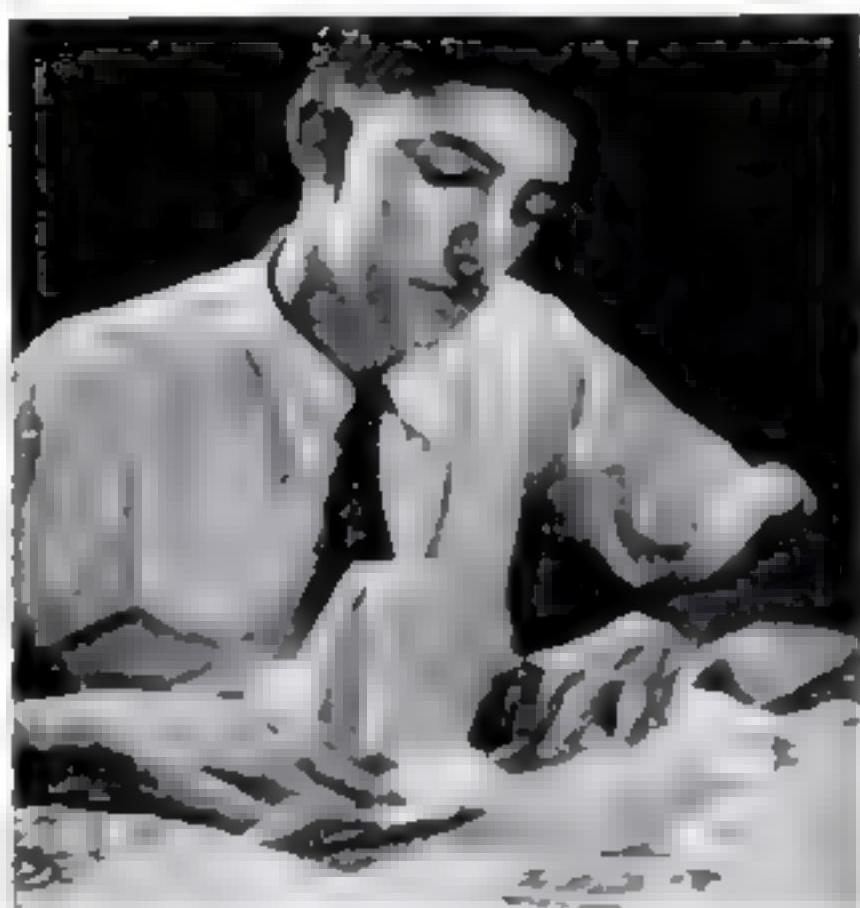

PUSHING A TUMBLER through a table and bringing it out from the underside is easy—if you know how. Place it mouth down on the table and press over it firmly several sheets of newspaper. Then lay a napkin over the mound, telling your friends it is to catch the pieces in case of mishap, and flatten the paper with a smart blow. Magically you produce the glass from your lap

CHALLENGE your friends to drop a coin and a paper disk of the same size or smaller from equal heights and have them reach the floor at the same time. After they have tried unsuccessfully, show them that it can be done by smoothing the paper disk on top of the coin, which is held horizontally before release. Lowered air pressure above the coin during its fall will hold the paper on securely. Any other method of releasing them will cause the disk to flutter down far behind the coin.

TABLE TRICKS

under the table! The pressed papers, of course, make a form that seems to contain the tumbler which you carefully slide into your lap during the preparations.

One way to add interest is to pretend to fail several times in an attempt to make a coin disappear from under the tumbler. Then fake anger and strike the mound sharply to do the glass trick instead.

THREE CHECKERS touching in a row can be made to perform their own special trick. Ask your guests to try to put one of the end checkers between the one in the middle and the one at the other end—but to make it hard, specify that the middle checker must not be moved and the checker at the far end must not be touched! Here's how to do it. Hold the middle check against the table; then draw one of the end checkers back and hit the middle checker with it solidly. A compression and expansion wave passing through the middle checker will bounce the third one far enough away to leave plenty of room between the two.

LOWERING A MATCH below the surface of water and having it remain lighted is really just a gag. Place the lighted match across a flat cork floating in water in a deep dish, and place the mouth of a large tumbler over it, lowering it to the bottom. Air pressure in the tumbler will depress the water, and the match will drop below the surface of the remaining water in the dish! For an extra flourish, raise the tumbler quickly enough and the match will stay lighted.

THOUGHT PROJECTION is often done professionally on the stage. You can demonstrate it at home; but you are apt to get varying kinds of reaction from your friends. Write a word on a slate or a sheet of paper and keep it concealed. Select one listener and say that you are concentrating on the word. Tell him that

you want him to be perfectly frank—that if you fail, it will not be the first time. Then ask: "Can you tell me the word I have written?" Of course, he will answer, "No." And now you will astonish him by exclaiming: "That is absolutely right!" What you have written on the slate is the word "No"!

USE OF A BALLOON to lift a tumbler seems impossible only if you aren't in on the secret. Drop a lighted paper match into the bottom of the glass and, while it is still burning, place the balloon in contact with the rim. Amazingly, that part of the balloon within the rim will begin to bulge and, when the match has gone out, it will provide a firm grip for lifting the glass! What happens is that a partial vacuum is created by the consumption of oxygen in the glass.

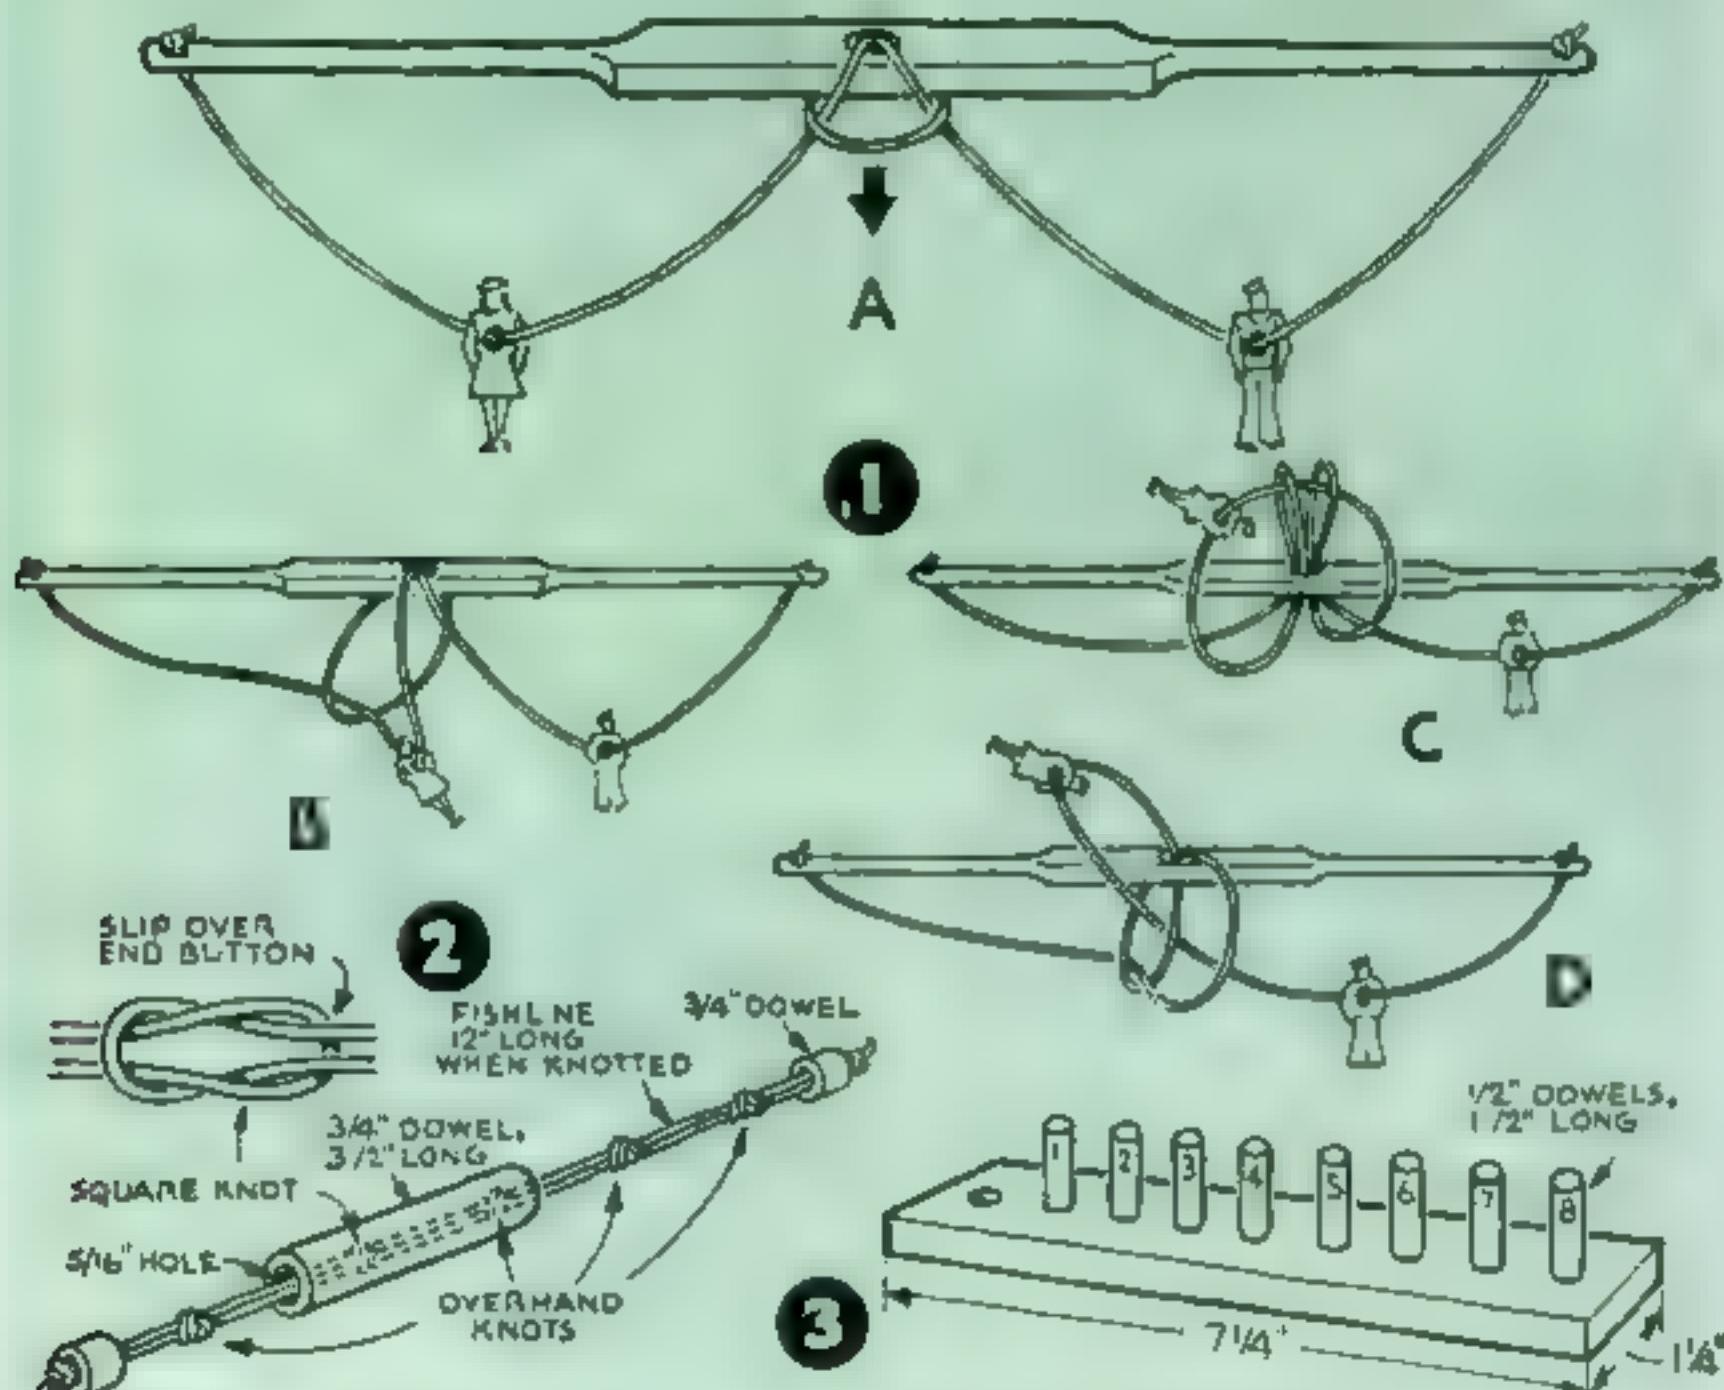

REVERSING THE CORKED END of a cigarette is one of those tricks that must be performed quickly and the "prop" put away. Cut the cork-tip end from a cigarette, remove the paper carefully from inside the tip, and open the cord strip where it overlaps. Now, wrap this cord band around a plain cigarette, gluing the ends together so it is just tight enough to slide along the cigarette. As shown in the photos, you put the cigarette, cork tip down, in one clenched hand, push it through, and pull it out from the bottom. The cork will have slid to the top!

MAGIC YOU CAN MAKE

1 HOW CAN BOY
meet girl when they
are in the fix illus-
trated below? It's
easy if she's a sailor's
girl and will cross the
spar to him. Pull loop
A down and slide the
girl through it, as at
B. Draw the loop up
through the hole in
the spar by pulling on
the two center cords.

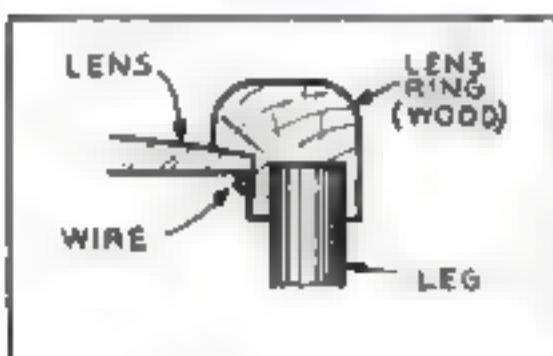

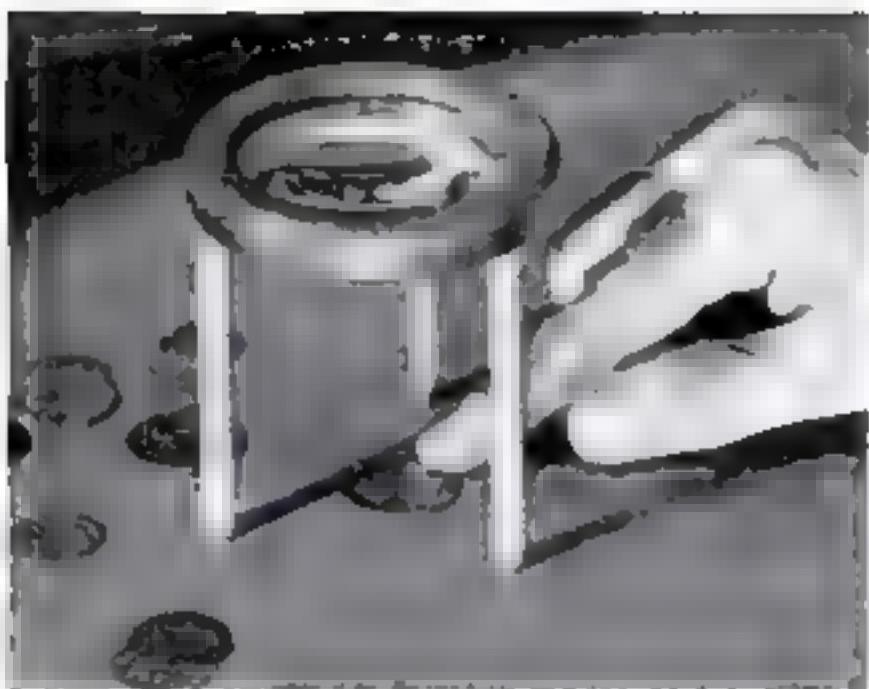

This puts the girl in
position to be slid
through the two loops,
as at *C*. Now, if you
will draw the double
loop back down
through the hole, as
at *D*, the girl can be
slid through to reach
her sailor! Then ar-
range the loop as it
was in the first posi-
tion.—R. M. COWAN.

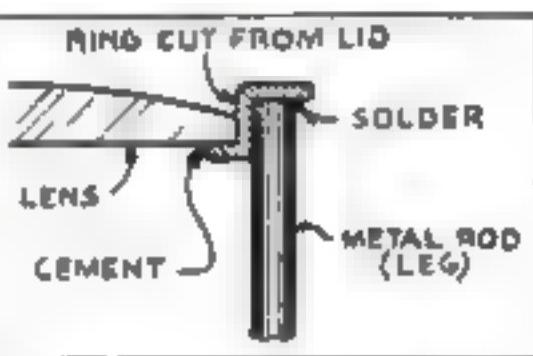

2 KNOTS IN A FISHING LINE will fool
your friends when they try this trick.
The problem is to get the long dowel off
the knotted line without removing the
short end dowels. You can do it if, in
preparing the trick, you make one knot
a square knot, while the others are over-
hand knots. Slip one of the square-knot
loops over an end dowel, and the knot
will pull apart. Instead of drilling dowels,
you can substitute package-carrier
handles. GEORGE BARR.

3 CAN YOU REVERSE the order of the
pegs in the board so that No. 8 will
be at the opposite end and the sequence
will read the other way? Move either by
jumps or single moves. You can make it
into a game, with the winner the player
with the smallest number of moves.
Here's one solution, in 36 moves. Shift
the pegs in this order four times, always
jumping to an empty hole: 2, 4, 6, 8, 7,
5, 3, and 1; and then move 2, 4, 6, and
finally 8.—G. B.

Simple Tripod Stand Supports Magnifying Lens at the Correct Distance Above Work

ONE of the handiest little optical devices for the home, shop, office, and laboratory is a tripod magnifier. It consists of a positive lens in a mount supported by three legs of such length that the lens focuses sharply on the surface upon which they rest. It is particularly useful for examining stamps, coins, fine drawings, pressed botanical specimens, and the like. One caution should govern its use: it should never be left where the sun might strike it and start a fire by a burning-glass effect.

Shown in the photos is a tripod stand turned from red cedar. The blank was fastened to a faceplate with the intended upper surface outward, the ring roughed out, and the lens recess formed by undercutting with an offset tool. A small boring bar could

have been used. Calipers were used to determine when the recess would receive the lens, after which the ring was finished and cut off. For the three legs $3\frac{1}{4}$ " lengths of $\frac{1}{4}$ " dowel were used, set into holes $\frac{1}{4}$ " deep and spaced 120 deg. apart. These holes may be bored at a slight angle to flare the legs outward a bit, though with low stands the legs may be set vertically. A split ring holds the lens. A different method of construction, shown in the drawing at the right, is to use a ring cut from the press-on lid of a small tin can.

Experiment to determine how far from a surface the lens gives the sharpest image with the eye at a comfortable height. In general, a lens with a focal length between $1\frac{1}{4}$ " and 4" is best.—ERVIN WALTERS.

Empty Film-Pack Containers Serve as Attractive Picture Frames

NEAT, simple frames for your contact prints may be devised from the containers in which film packs are supplied. Cut a cardboard backing piece to keep the print pressed against the aperture in the side of

the container. Use a small, knotted loop of string for hanging vertical photos, securing it by placing the knot in the V-shaped cut at the back of the container and then replacing the top.—WILLIAM SWALLOW.

His Photos Make the Bunny's Nose Twitch

WILL CONNELL, CAMERA CRAFTSMAN, TELLS HOW HE BRINGS THE FEELING OF LIFE TO PICTURES OF ORDINARY SUBJECTS

By Andrew R. Boone

ONE of photographer Will Connell's favorite expressions is, "Wait for the bunny's nose to twitch." Its meaning is simple—don't touch the shutter release until the scene before your camera tells the story that you want to catch. This valuable advice comes from a man famous for the scope, power, and infinite variety of his pictures.

Connell, who numbers among his clients national advertising agencies, top-notch magazines, and huge industrial plants, started out as a registered pharmacist. A

decade of pill rolling in a series of Los Angeles drug stores so bored him that he still considers the life of a photographer to be a fairyland existence.

There's more than a bit of the pixie in this creator of serious pictures. He much prefers a laugh-provoking novelty picture to a dramatic study of a 100-octane gasoline tower. This feeling for humor is due, he says, to a brief experience he had as a cartoonist on the Los Angeles Examiner.

From compounding drugs and drawing cartoons, curiosity led him into the photo-supply business. During this phase of his career, he found himself teaching the rudi-

Backyard Conversation Piece—Casual and Intimate, Yet Structurally Sound

Study in Contrasts—Rough-Textured Adult Hands Accentuate Baby's Delicacy

ments of photography to his customers. Eighteen years ago, in 1927, he decided that he could succeed as well as the men who were profiting from his advice; so he hung out his shingle, announcing his availability to all and sundry as a commercial photographer.

Today, roaming widely throughout the western part of the country, he functions as a critical interpreter of the American people and their environment. Catholic in his photographic tastes, he prefers not to be considered a specialist. His assignments come from a variety of sources—on one day he may busy himself filling a hurry-up order for a full-color magazine cover, on another day he may stalk dramatic effects in an industrial plant for a national advertiser, and on still a different day he may spend his time shooting book illustrations for his author-wife.

Hal Stebbins, a well-known advertising man, pays this tribute to Connell: "When you look at a picture by Will Connell, you forget it's a picture. . . . He keeps the life that looks into his lens."

Connell considers that his success and consequent reputation have been built upon twin foundations. First, he works with a lavish hand, making innumerable negatives and everlastingly seeking to tell a story rather than merely to snap a photo. Second,

he manipulates his negatives in the darkroom as an etcher works with his plates, striving patiently to produce the exact print values desired. Sometimes his work has the sure audacity of a steam locomotive, while at other times it displays the precise delicacy of a fine watch. He may make 10 or 12 prints before he finally achieves on paper the interpretation he seeks.

He hopes always to remain an unbiased, eager, experimental, and unorthodox student of the graphic arts. For instance, although he is not too fond of miniature cameras, he often uses a Contax just to prove to himself that he has an open mind. He went out recently with two Speed Graphics, a Grafex, and the Contax, all hooked to one synchronizer, to take full-color pictures of a cowboy riding a bucking bronco. Three times in the yellowing afternoon light he flashed the scene. He found later, to his amazement, that the hand-held Contax had captured the best picture—on 35-mm. Kodachrome at 1/1,000-second.

Some first-flight photographers consider that elaborate props are essential. Not Connell, though—he uses his living room as a studio, and if conditions require it, will not hesitate to process his negatives in a bathroom. Only occasionally does he employ professional models. Usually he's to be found hunched behind his camera "on

location." Before every setup, he makes pencil sketches, which, he admits, are "undecipherable by anyone else."

Most of his work is done with a 4" by 5" Korona and a 3½" Schneider-Angulon lens, set on a studio tripod. He has extensively

Besides these two cameras, he has six others in current use. Although most of his color work is done on 4" by 5" Kodachrome, he occasionally sets up a one-shot color camera that he developed when color was in its infancy. He also uses a 5" by 7" Ansco, a 4" by 5" reflex, and a Contax with an f/1.5 lens.

As an inflexible rule, he practices with a new camera in the dark until he can focus, shoot, change plates, and shoot again without watching what he is doing. He drills regularly with both the Korona and the Speed Graphic. Notches cut alongside the focusing scale—on the Korona at 8' and infinity and on the Graphic at more frequent intervals—enable him to make accurate adjustments simply by his sense of touch. As a matter of routine, he unlimbers his equipment, sets up the Korona on the tripod, focuses, and makes a single-flash picture in 90 seconds. "Any craftsman," he emphasizes, "should be able to do his job without wasting time fiddling with his tools."

Of the eight lenses in his

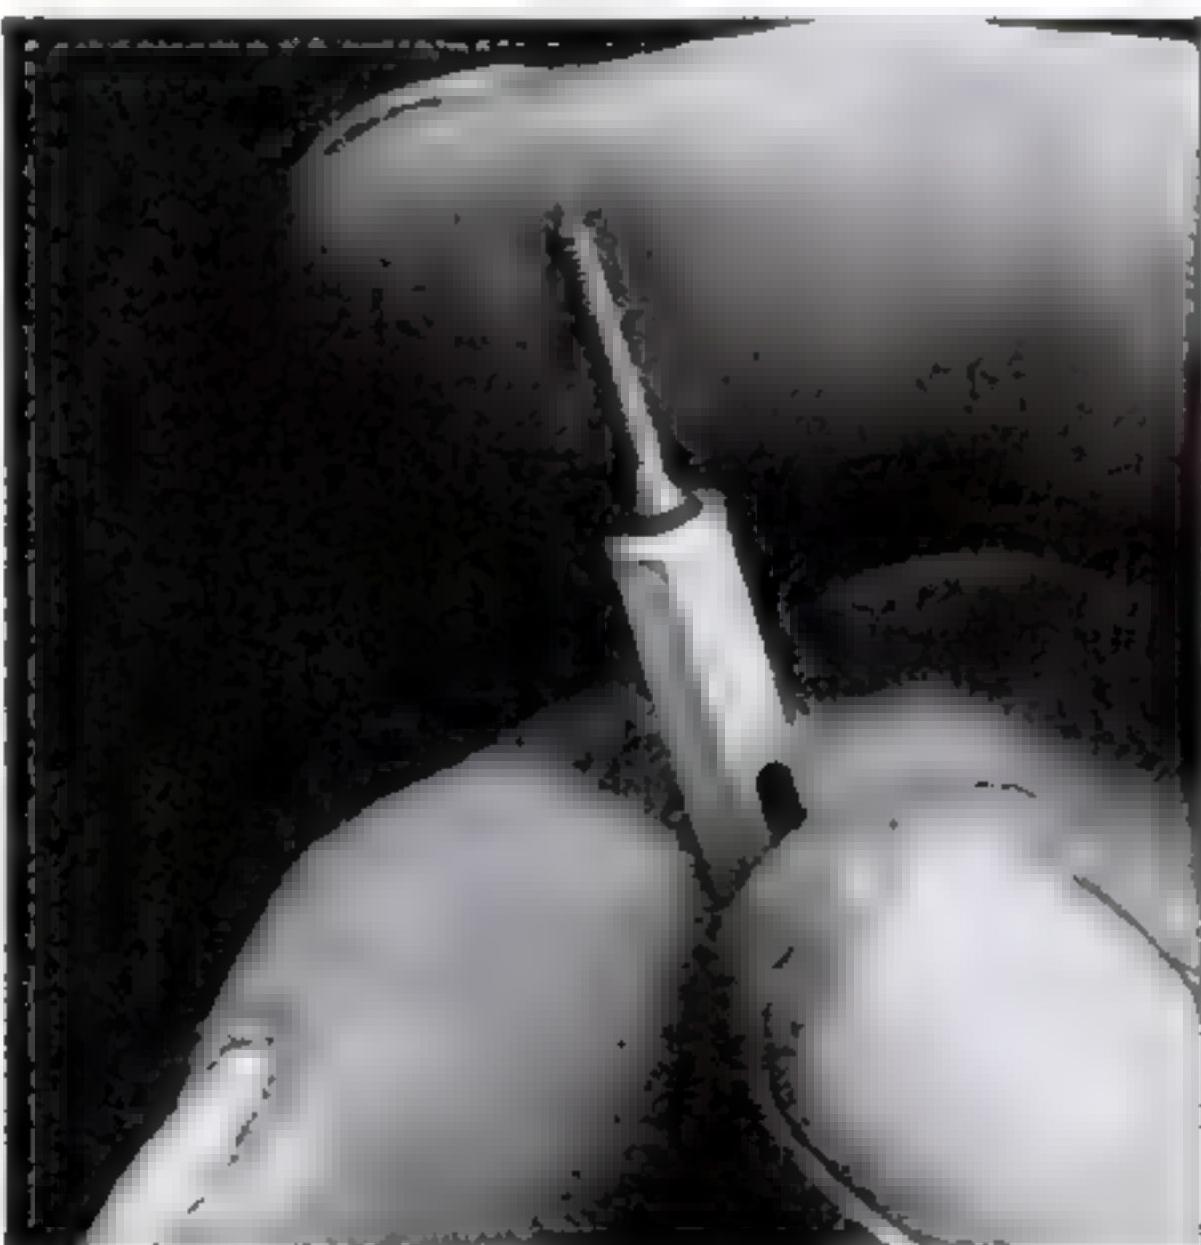

Will Connell, Camera Craftsman

altered the camera to suit his requirements. Seldom does he shoot faster than 1/50 second, although the Korona is capable of 1/200-second shutter speed. A synchronizer gives him a flash source at the camera. If the occasion demands, it can be augmented with batteries of flash bulbs.

Why a tripod? "I guess there's something of the plumber and the amateur in me," Connell confesses. "With my camera on a mount, I can deliberately take time to think through to the desired effect before taking a picture."

Though he considers a view camera such as his Korona to be the basis for any serious work, he employs a Speed Graphic when there's action to be shot, particularly if he wishes to take several shots in rapid succession, or if he must work in a crowded room.

Industrial Subject—A Thread Gauge

Legato—A Dramatic and Powerful Study

carrying case, his favorite, circumstances permitting, is an 8 $\frac{1}{4}$ " Steinheil Caasar, f/8.5. For portraits he uses a 10 $\frac{1}{2}$ " Caasar, which he claims brings out the roundness of heads in a superior manner. "I prefer to use the longest lens that will maintain the angle of view, because it gives the most acceptable perspective," he says. "Remember, the eye is equivalent to about a 9 $\frac{1}{2}$ " lens on a 4" by 5" field. Shorter lenses tend to rub your nose in the subject."

He sticks pretty close to high-speed films of one standard brand, because through long familiarity he knows the results he will obtain. To speed his work on a job, Connell has standardized on 4" by 5" plate holders for all his cameras except the Contax. This makes for economy and does away with the necessity of carrying a variety of film on an assignment that requires the use of more than one type of camera. He prefers 4" by 5" negative to larger or smaller ones because he finds that people tend to freeze in front of a large camera, while images on a small film are too minute for quick study. He considers 2 $\frac{1}{4}$ " by 2 $\frac{1}{4}$ " to be the smallest practicable size. If he should ever lose his present cameras, he probably would adopt 8 $\frac{1}{4}$ " by 4 $\frac{1}{4}$ " as his new standard size.

On assignment in an industrial plant, he spends hours roaming through the buildings, climbing over scaffolding, crawling around piping, and making his unintelligible sketches to develop the pattern and mood before he shoots. Painstakingly he experi-

ments with the placing of lighting, attempting to make it flow over and envelop the subject. Angles of attack are plotted to give a normal, receding plane of values. The foreground is planned to provide contrast of a sort that sets up an interesting pattern, serves as an interrupting form, and, most important, emphasizes the horizontal depth of the scene.

The picture on page 176, showing the four-way intersection between Connell's and his neighbors' back yards, is a preliminary black-and-white study of a scene that he later photographed in color for a magazine cover. (The color shot was never used because the magazine editor didn't like the incinerators in the foreground.) Of the picture, Connell says, "There's a nice, intimate, homely feeling here. The design and pattern make the picture structurally sound. It's quite unstudied in appearance, too, but I worked like the deuce for that effect of casualness." Concerning the next picture—the one showing the baby on his father's lap—Connell remarks, "The contrast between the homely, honest, rough hands and the delicate baby suggests strength and security."

A study of Connell at work in a darkroom appears on page 178. He prefers to do his own developing and printing, feeling that they are just as important in achieving the desired result as is the original conception and shooting of the subject material.

Trifles sometimes become tremendous

Midday Interlude—Typical Americans In a Natural, Unstudied Pose

when recorded by Connell's camera, as witness the 1/16" thread gauge on the same page. The rough, white-paint-smudged texture of the fingers emphasizes the smallness, precision, and delicacy of the tool. The shot was made with his triple-extension view camera, racked full out. A 5" Turner-Reich convertible lens was used, giving him a total stop of about f/256. Five Wabash No. 0 flash bulbs illuminated the scene at an exposure of 1/25 second.

In the next picture—of a musician's hands—you aren't conscious of the photographer's presence. You feel that the hands are playing, dramatically and with power. Connell removed the keyboard from the piano to avoid using a mirror, which would have limited the camera angle.

On this page, the arresting study of workmen at lunch is so natural, casual, and unstudied that you feel as though you were with these men, not merely looking at a photograph. Connell used full daytime exposure and a single flash bulb at the camera—a hand-held Speed Graphic. The picture was taken on Super Panachro Press type B film at a speed of 1/10 second

and a diaphragm aperture of f/16. The flash picked up the foreground and faces, while the background remained normally lighted.

The close-up at the bottom of the page was shot with an overhead ultraviolet light. A spot was used to pick up the hand and the incidental shadows. The photo shows two optically flat glass disks and two Johannson blocks. Newton's rings appear where the blocks touch the upper disk. The picture is purely scientific, but to liven it up Connell used a hand and an irregularly shaped piece of paper for contrast. It shows good design and is an effective presentation of the manufacturer's precision product.

Pictorial Science—Testing Gauges for Accuracy

PHOTO IDEAS

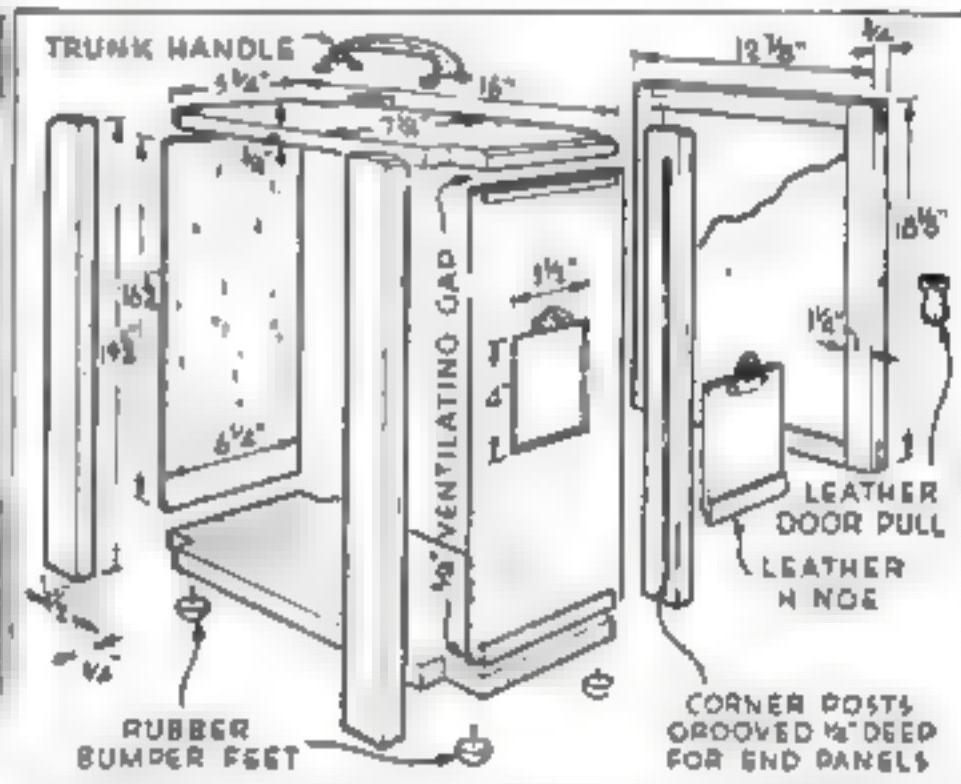

Doors forming the sides of this case provide ample room for changing of a reel belt or lamp.

The use of plywood gives strength and light weight. A trunk handle is bolted to the top.

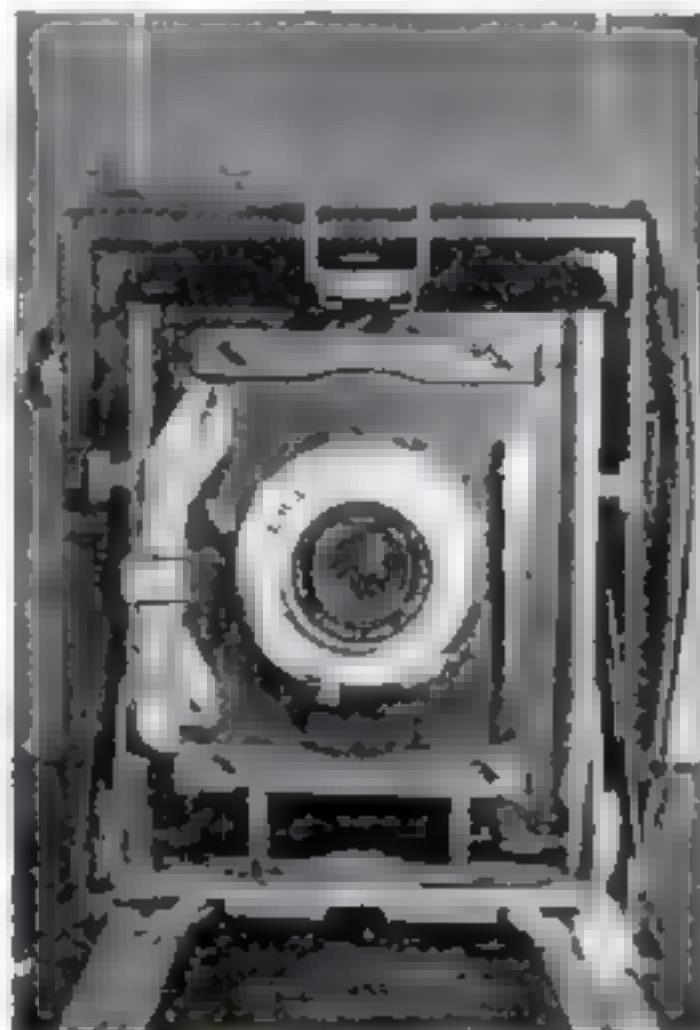

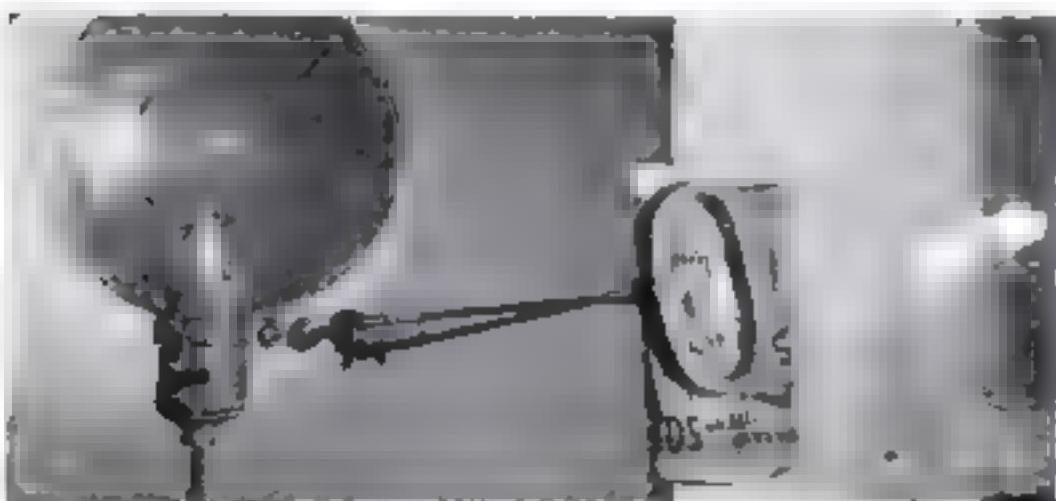

YOUR HOME PROJECTOR can be set on a table in this case and operated without being taken out, for the case serves as a permanent housing as well as for carrying and for storing. Ventilation sufficient for an hour's showing is provided by $\frac{1}{4}$ " gaps above and below both the front and back panels; while full ventilation for longer operation may be had by swinging the two doors wide.

Use plywood for the end panels and side doors and solid pine for the posts, top, bottom, and door frames. If the aperture in front of the lens is cut carefully, the cutout piece can be used for the small door there. In assembling, glue the end panels to the posts first, and then glue and screw the posts to the top and bottom. Friction catches will serve on the doors. Mount the projector with screws.—A. H. SMITH.

ATTACHED TO THE LENS BOARD of your camera, a camel's-hair brush will always be at hand for use when needed to dust the lens. Cut the brush handle off 2" or so above the ferrule, or at the most convenient length, and hold it by means of metal clips or screw eyes.—LOUIS HOCHMAN.

MARRING OF FURNITURE to which flash-lamp equipment is clamped can be prevented by attaching the clamp-on unit over a padding of cloth or cardboard. One convenient pad that you will always have on hand without carrying extra pieces is the corrugated paper sleeve in which an individual flash bulb is packed.—L. H.

NEW LIFE FOR THOSE

NO MATTER what is wrong with your old pliers, the chances are they can be fixed—often in such a way that they will look and work like new. Gripping surfaces can be reknurled if they have worn smooth; pin joints can be replaced; out-of-shape holes in slip-joint pliers can be trued up; and even broken parts can be mended by welding or brazing. If you want to add a special type to your kit, you may be able to pick up what you need secondhand and make a new tool of it by doing your own reconditioning work.

Any repair that requires intense heat will, of course, affect hardness, but this can usually be restored by rehardening and tempering. A brazed handle or jaw may not be as strong as the original, but you can get a lot of service from it if you use a little care. Durable enamel on the handles and other parts that do not come in contact with work will improve appearance and retard corro-

BEFORE rehabilitation these pliers looked their age

sion. A bright color, such as red or yellow, will help you to spot the tool quickly on a bench or to find pliers that have been dropped on the lawn.

The secondhand pliers shown above are a type noted for strength and cutting ability. First, the old bolts, which had been riveted and welded by a former owner to keep them in place, were removed by sawing off the nuts, as shown in Fig. 1. This could have been done just as well with a coarse grinding wheel. The pliers were then taken apart and cleaned with emery cloth until most of the original luster was restored. A little oil now and then will help to preserve this finish.

Next, the cutting edges were sharpened

1 Pivot bolts had been riveted and welded to make them hold. The nuts were cut off with the aid of a hacksaw, and the bolts were then pressed out so the pliers could be taken apart

2 Cutting edges, too hard for a file, can be sharpened with an abrasive stick. If they are case-hardened, don't cut down to soft metal

3 When gripping jaws have worn smooth, use a triangular abrasive stick to roughen the surface, following the original knurling marks

11 After a rivet has been countersunk on both sides of a pivot joint, the heads are filed flush with the surface of the jaws for neatness

12 Long jaws are aligned by hammering lightly while one jaw is supported on each side of the joint. Turn the pliers to tap the other jaw

countersink each piece once more so as to give sufficient shoulder area for the new flush rivet which you will install.

Make the new rivet of cold-rolled or unhardened steel to fit the reamed holes snugly, and cut it $1/16$ " or so longer than the original rivet. Peen one end into one of the countersunk recesses with a light hammer, and then repeat for the second end, being careful not to lock the jaws too tight. If a light hammer is used, it is unlikely that the rivet will be upset for its entire length and in that way bind the joint. Finish the peened ends by filing them flush, as in Fig. 11.

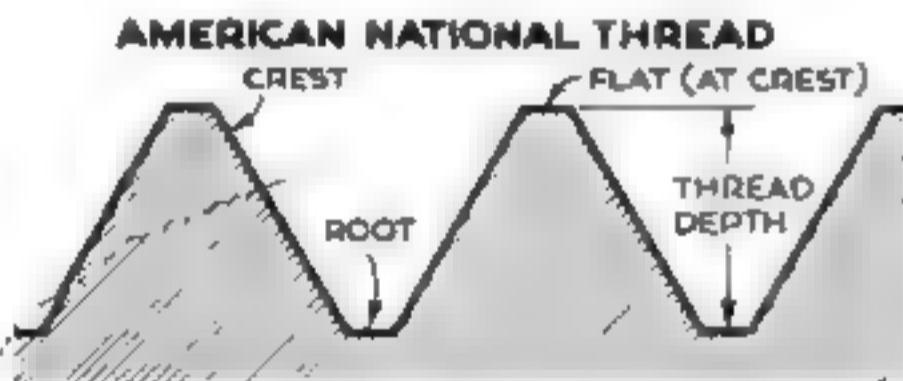

The long, slender jaws of chain-nose and needle-nose pliers frequently get out of alignment. One way of remedying this is to lay the pliers so they will be supported at two points $\frac{1}{2}$ " or so on each side of the rivet and then to strike the joint a few times

with a plastic, lead, or rawhide hammer. This will bend the supported jaw slightly upward. The pliers should then be turned over and the other jaw given the same treatment. Figure 12 shows the operation with the pliers resting over a hollow spot formed by a shallow ledge in a bench anvil. It may be necessary in some cases to bend the jaws for their entire length. Use care not to strike blows so heavy that you will risk breaking the pliers at the joint.

After repairs that require brazing or welding, harden to suit the kind of steel. If this is unknown, try heating the metal to a cherry red, quenching in water or oil, polishing a bright area, reheating until this turns purple or blue, and then letting the tool cool to room temperature. A mixture of linseed and automobile-engine oil is satisfactory for hardening if you do not happen to have regular quenching oil at hand.

DEPTH OF THREADS

When threads are cut in the lathe with a single-point tool, and when you are using the micrometer collar to regulate the straight-in depth of cut not the 30-deg feed you will save time by knowing the total amount of in-feed (thread depth) required. The table gives single-thread depth for American National threads of various pitch that is from the flat of the crest to the root of the thread.

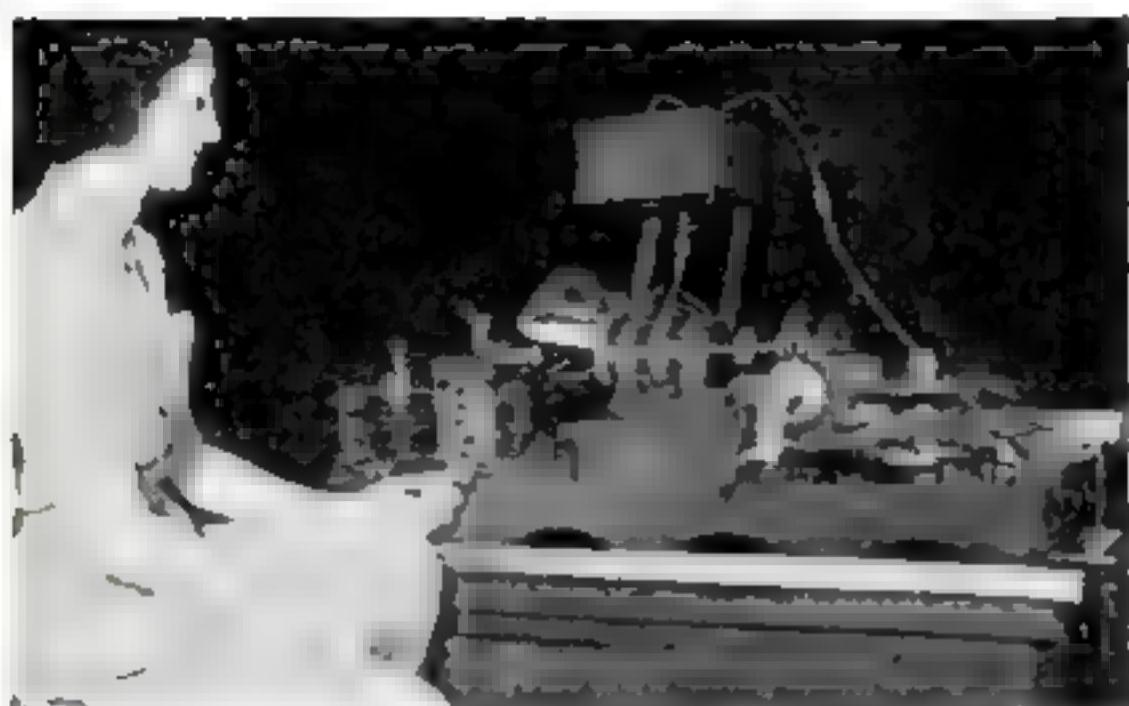

[SHOP PRACTICE]

If your threading tool is properly ground, you will obtain a satisfactory thread by cutting to the depth indicated in the table. For a sharp V thread the feed should be somewhat greater to compensate for the absence of flats. This type of thread, however, is not often desirable.

| Threads per Inch | Depth of Thread | Threads per Inch | Thread Depth of |

POPULAR SCIENCE MONTHLY SHOP DATA

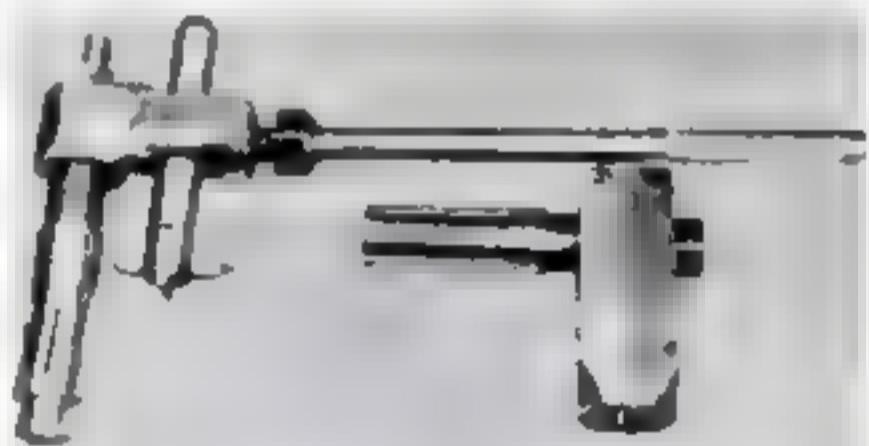

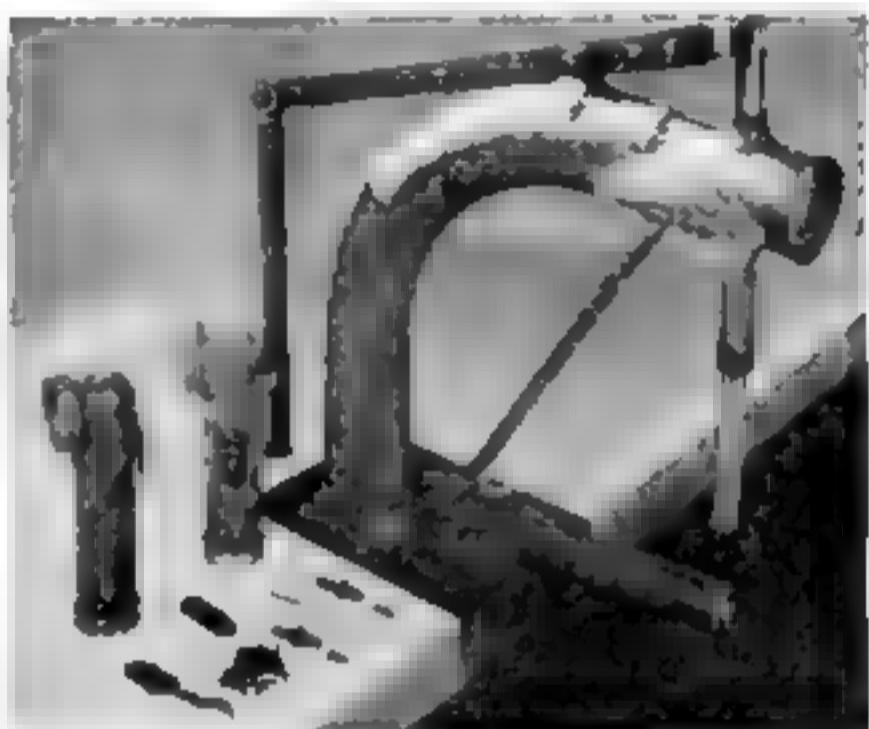

TWO IRREGULAR CURVED TRACKS of minute dimensions are cut in the inside surface of a thumb-sized barrel cam in 15 minutes by a new cam-cutting machine developed by the Fairchild Camera and Instrument Corp., of New York. Formerly, cutting these tracks took 80 hours. The cam is an integral part of an electric gunsight for aircraft. In the above picture, an operator is holding one of the cams and the cutter is in the background. It consists of a 5,000-r.p.m. electric motor, a carriage, a chuck, two master cams, a cutter head, and stationary followers.

WORN SOLID TRUCK TIRES are reconditioned at the Warner and Swasey Co., Cleveland, Ohio, by removing the high spots in a lathe. Although some rubber is cut away, the life of the remaining rubber is prolonged because the smooth contour insures a more uniform distribution of the load. Efficiency is also increased since the truck can operate once more at normal speeds.

SCRAPPING FLASHLIGHTS because of defective switches has been halted by the machine shown below. The device, made from scrap metal at a cost of \$5 by Thomas P. Davis, an employee of the Fort Sill Signal Repair Shop, Army Service Forces, first punches out the rivets that hold the defective switch and then rivets a new switch in place. A new flashlight, even if available, would cost at least 50 cents; a new switch, replaced by this machine, costs but 10 cents. The punch is actuated by a pedal beneath the bench.

DAMAGED THREADS of truck axle housings may be repaired without removing the parts from the trucks through the use of the hand-powered die that is shown above. It was devised by Elmer C. Adams, an employee of the Army Service Forces motor-maintenance shop at Fort Sill. He built the die from scrap steel at a cost of \$25. It is claimed that an annual saving of \$1,140 has been effected as a direct result of using this tool in the motor-maintenance shop.

CLAMP TOOL KNUURLS SLENDER WORK

By C. W. Woodson

LONG, slender parts can be worked readily with a knurling tool of the clamp type shown here. The knurls are sunk into the workpiece from both top and bottom when the wing screw is tightened, thus eliminating the heavy side strain that springs slender work when knurling is done in the customary way. Hold the tool in your hand and run the lathe at its lowest back-geared speed. Keep both the work and the knurls well covered with oil. Practice shows the best depth at which to tighten the screw.

The knurl holder is two short lengths of $\frac{1}{2}$ " by $9/16$ " cold-rolled steel hinged with a pinned link that gives a floating action to the knurls and permits them to adjust themselves accurately for centering the work. Slots for the knurls can be made in the drill press with a $5/16$ " end mill. Cut a slot in the end of each bar for the link with a $1\frac{1}{8}$ " end mill. The elongated holes for the wing screw can also be cut with the $5/16$ " end mill. Holes for the link and knurl pins are

Slots for knurls, hinge, and tightening screw are cut in both handles with end mills chucked in the drill press. That for the hinge is filed square

drilled undersize so that these must be driven in.

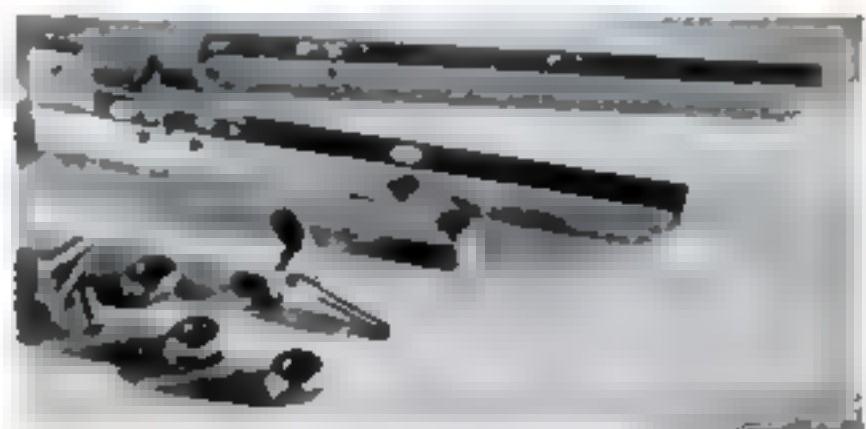

Three hardened and tempered tool-steel knurls should be purchased. The holes for pinning them are laid out in the drawing for $\frac{1}{8}$ " diameter knurls. If the size of those you obtain differs from that, space the pin holes so the two lower knurls will be close together and near enough to the upper edge of the bar for the knurls to clear and reach the work. The upper knurl is centered between the two lower ones, its pin also being located close to the edge of the bar.

A short plug is made up, drilled, and tapped to receive the tightening screw. It should swivel freely in the hole drilled at right angles to the elongated screw hole in the lower bar.

All pins are short lengths of $7/32$ " diameter drill rod, which should allow the knurls to turn freely. Holes in the link of the size specified permit easy swiveling.

All parts of the knurling tool are shown below, with the hinge link pinned to the lower bar. The link must be just under $\frac{1}{8}$ " thick for free action

Is Your Doorbell

By TRACY DIERS

Door chimes rarely get out of order, but they will not work if your battery or transformer is dead or if the wiring is shorted.

If dry cells operate your bell or chimes, slide off the covers and look for white spots where the zinc has been eaten away. Test cells that seem good by touching wires to your tongue.

Another way to test dry cells is with a flashlight bulb connected to the terminals. A transformer should be tested with a small bulb or with a wire shunted across its terminals (right).

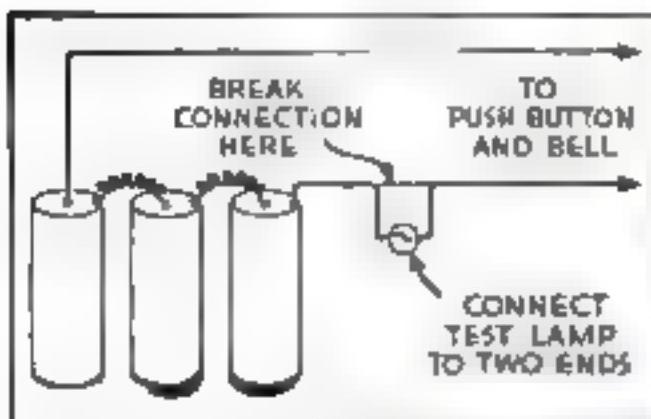

HIGH up in the list of annoying if minor troubles that beset householders is the doorbell that refuses to make a sound, however vigorously the button is prodded. Almost as exasperating is the bell that responds only occasionally—when it feels like it. Either of these tricks of recalcitrant doorbells can cause real annoyance if a friend can't summon you to the door, or if a deliveryman must go off with an undelivered package.

With almost no equipment, but with a system, any novice can tackle the job of putting a dead doorbell back on its feet. The system is this: (1) test the source of the current; (2) test the push button; (3) test the bell itself; and (4) test the wiring for shorts.

Dry-cell batteries are the usual source of bell current in old houses, transformers in more modern ones. Slide off the covers of dry cells and look for large white spots where the zinc jackets have been eaten through. Any cells with these spots should be replaced. The others should be tested separately by connecting a short length of wire to each terminal and trying the ends with your tongue, an iron file, or a two-cell flashlight bulb. You will get a strong, sour taste, a spark, or a dim light from a good cell. In connecting up the cells again, be sure to put them in series.

Test a transformer with a short wire or an automobile dashlight bulb shunted across its terminals while the regular circuit wires are disconnected. If you don't get a spark or a light examine the 110-volt line to the transformer; if this is in good condition the transformer is burned out and must be replaced. It will be well to describe your bell or chimes to your dealer in electrical supplies so you will be sure to get a new transformer of the proper voltage. Bell transformers are designed to give current only for short periods, so make your tests brief and not too frequent.

Dead as a Doornail?

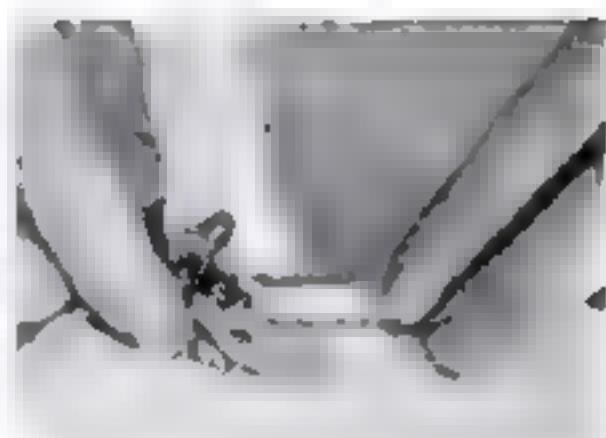

A bulb helps to locate a short. The cells are shown wired in series

Remove the push button and place a wire across its terminals to check it. If this makes the bell ring, the button points may need cleaning with fine sandpaper, or they may require bending to make contact. A spark and no ring may indicate a short or a failure of the contact points in the bell to break. Disconnect the wires at the bell terminals and test the push button again. A spark this time is a sure indication of a short. If there is no spark, examine the bell.

Some accident may have bent the stationary contact point against the other in the bell so that they cannot break, or vibration may have loosened an adjustable contact screw. Either can be easily corrected. But first put an automobile dashlight bulb across the wires taken off the bell terminals. If the bulb lights when the button is pressed, current is available and the wiring and push button are all right.

Connect the wires to the bell terminals again and have somebody push the button while you watch the bell. If the clapper moves but strikes the bell only once or not at all, the vibrator contacts are not breaking correctly. Loosen the lock nut with pliers and turn the adjustable contact screw counterclockwise to draw it back slightly from

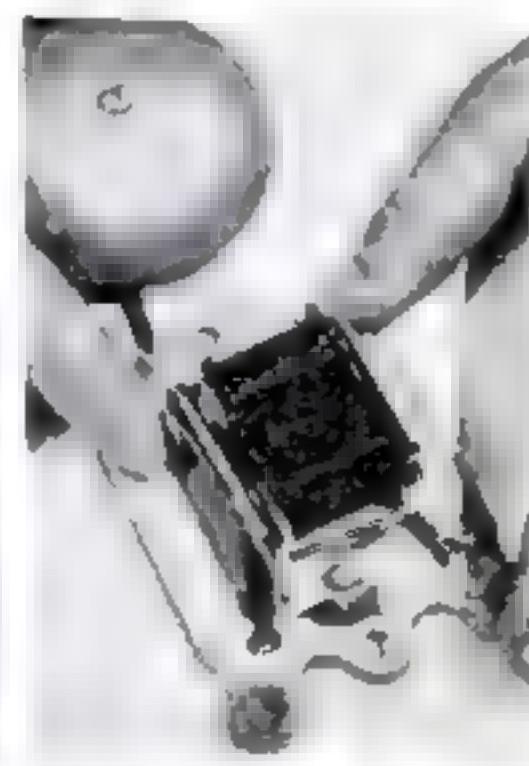

Test a push button by placing a wire across its terminals, as shown at the left. If this causes the bell to ring, the contacts inside the button should be cleaned with fine sandpaper. Make sure the button terminals are tight

Clean contacts are also a first requisite in the bell itself. Run a stick of fine sandpaper between the vibrator points; then loosen up the lock nut to adjust the gap for the best bell sound

If your bell has no lock nut and adjusting screw, you can set the contact-point gap by gently bending the fixed bracket with one finger, as at right below, until the bell rings as loudly as desired

Counterclockwise turning of the adjusting screw corrects for faulty breaking of the vibrator points, while clockwise turning closes up points that don't touch. Turning also adjusts the tone and volume

Although chimes are protected by a cover, kitchen grease may work in. Check the plunger to see that it slides easily in the solenoid. If it doesn't, wipe it with cleaning fluid

the contact on the clapper arm; then try the bell again. If it vibrates but the clapper does not hit the bell, bend the thin part of the clapper arm slightly. Adjust the points to produce as rapid a vibration as possible.

If the clapper does not move at all after the wires have been reconnected, the points may be dirty. They should be cleaned first of all with fine sandpaper. If they do not touch when the clapper is at rest, loosen the lock nut on the adjustable stationary contact and turn the screw clockwise while someone presses the push button. When the bell starts ringing, tighten the screw to adjust tone and volume. Bells that do not have screws and nuts can be adjusted by press-

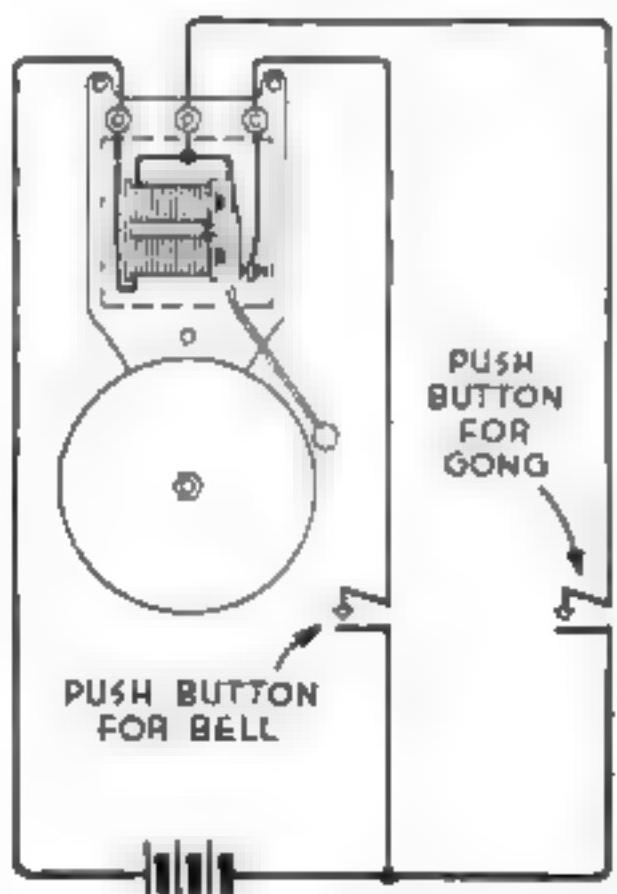

ing the stationary bracket toward or away from the vibrating armature.

Occasionally the armature may adhere to the magnet poles. Pull it free carefully and try the bell. If it rings, note whether the armature again sticks. It may be because of a slight residual magnetism, which can be overcome by a piece of thin paper pasted on the pole faces of the magnets. This prevents metal-to-metal contact and forms just enough of a gap to prevent adhesion.

Door chimes rarely get out of order because they have no sparking parts, but, of course, the battery or transformer, the push button, and the wires may develop the usual troubles. Chimes operate by current passing through a solenoid that sucks a plunger in,

and this plunger hits the chime. Check the plunger to see that it slides freely. Wipe off dust and grease with dry-cleaning fluid.

To test for a short circuit after determining that the battery or transformer is good, remove a line wire and connect your test bulb to it and to the source of current. If the bulb then lights up, there is a short, and every inch of wiring must be checked to find it. Look especially for places where insulation has been scraped off, and tape them. The light will go off when the short has been corrected. Although this checking is tedious, it may repay you if your wiring is old, for a short can discharge a battery or burn out a transformer.

Trick Hookup Provides Two Signals

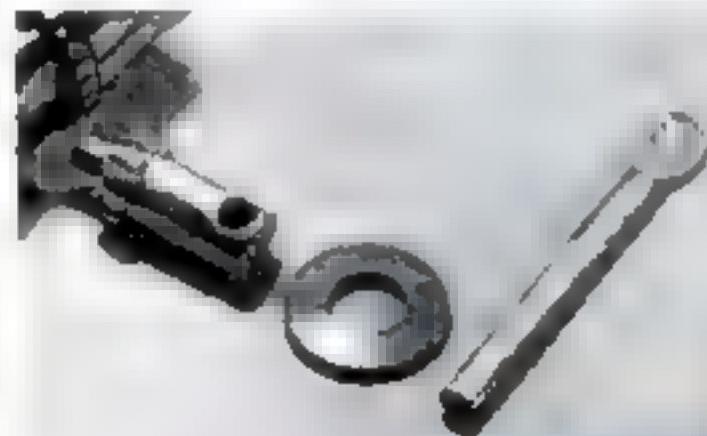

WHERE callers may come to either a front or a back door, it is usual to connect a bell to one push button and a buzzer to the other so the tone will tell which door is to be answered. However, if only a bell is at hand, or if still a third entrance is being used, a trick circuit will afford two distinct sounds from one ordinary bell.

All existent wiring is left intact, but from that side of the battery connected to the first push button a new wire is run to the second push button. From the other terminal of this button a wire is run to the bell, but not to a terminal. It is connected instead, either by soldering or by securing it under a screwhead, to that end of the coil winding that goes to the vibrator points. This connection will cause the clapper to strike only once. It may be necessary to bend the clapper arm slightly to obtain a clear note. Check to be sure the bell also rings normally.

—NEW SHOP IDEAS—

KEY-TYPE CHUCKS are dangerous because an operator's fingers may be severely pinched between the teeth on the chuck and key. To prevent such mishaps, install a large washer on the key shank so it will act as a shield. Ream or

turn the washer hole to a diameter that permits it to fit either loosely or tightly on the shank, according to your preference; then drive the key handle out of its hole, slip the washer over the shank, and replace the handle, driving it in firmly.—W. E. B.

Courtesy of Warner and Swasey Co.

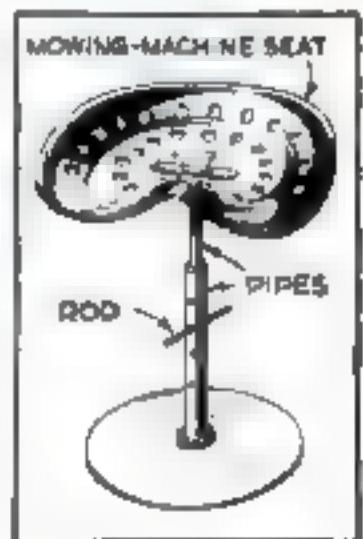

SPHERICAL HEADS may be produced on a large quantity of duplicate parts with the accessory shown at the right. Bolt an angle bracket to the face of the cross slide and mount a suitable pivot block on the rear way of the lathe. Two alternate types are shown at the right—one for a V-way, the other for a flat way.

Make a flat link of appropriate length and drill a hole at each end of it, spacing the two holes a distance apart equal to the radius to be machined on the work. Mount the link by means of two close-fitting pins or bolts that thread into the pivot block and angle bracket respectively. As the cross slide is advanced, the swivel action of the link moves the carriage along the lathe ways in such a manner that the tool bit travels in an arc.—R. WASHBURN.

FOR BENDING small parts, this jig is ideal. It consists of two $\frac{1}{4}$ " square steel blocks, which are fastened together with studs, as shown. To use it, slip the stock to be formed in the jig, line it up, secure the jig in a vise, and bent the material to the shape you wish.
—W. E. KOTTMEIER.

WELDERS will appreciate this adjustable stool, suggested by *Oxy-Acetylene Tips*. Weld a length of pipe to an old farm implement seat. This slides in a second pipe of larger diameter, which is welded to a round scrap-plate base. Drill several holes through the outside pipe and one, slightly larger, through the inside one. Insert a welding-rod stub in the appropriate holes to hold the seat at the desired height for the job at hand.

Hitching

HOW CARRIER-CURRENT COMMUNICATION

This equipment sends and receives civilian-defense messages at R.F. frequencies on A.C. power lines

By JOHN W. CAMPBELL, JR.

BECAUSE it costs a good deal to string even a single wire over any considerable amount of landscape, telephone and telegraph companies have developed various means of sending two, four, or even several hundred messages at the same time over one conductor. One of the most interesting is called "carrier-current communication." This is really nothing more than wired wireless, for it consists of harnessing radio waves to a conductor instead of broadcasting them freely from an antenna.

With the parts of two honorably retired radios, a few extra gadgets, and a single homemade coil, you can rig up a carrier-current outfit for communication over your electric power lines. You can place the sender in the nursery, take the receiver along while visiting neighbors, and then hear the baby if it should wake up while you are in the middle of your bridge game.

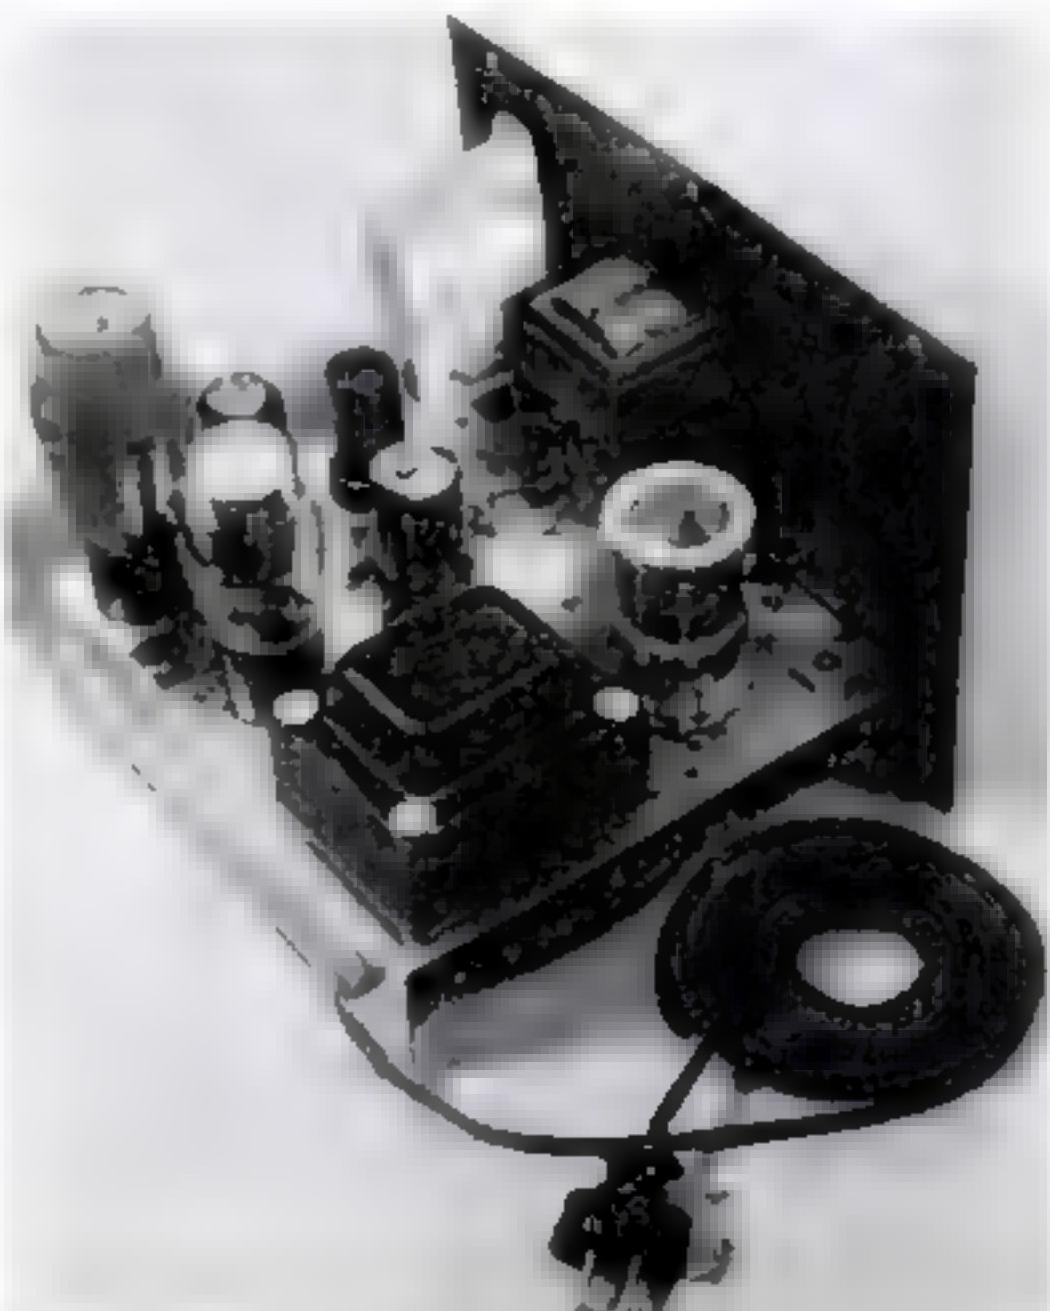

All the radio stations in the world put their signals into a common ether, from which any desired signal

Note the hand-wound coil at extreme right of the transmitter chassis. The six turns of the secondary are wound over the primary

can be unscrambled by means of a receiver tuned to the right frequency. In the same way, if six or six hundred signals of different frequencies are led into a copper wire, they can be taken off one at a time by suitable tuned circuits. Electric power companies send a constant 60-cycle signal along their mains—the power itself. But they also feed in signals at 50,000 to 100,000 cycles per second, which are audio modulated like the carrier wave of a radio station. Thus the engineer at one power station can communicate with another by means of a suitably tuned sender and receiver.

Amateur radio communication requires a license and is entirely prohibited during wartime, but carrier-current communication does not require a license so long as the carrier wave is not "broadcast." The FCC defines broadcasting in terms of the amount of energy detected at a certain distance from a wire or antenna. So long as the output is limited to 10 watts and the frequency is kept between 150 and 200 kc., a carrier-current transmitter will be within the permitted range.

Lower frequencies should not be applied to

Radio Waves to a Wire

WORKS SHORT RANGE EQUIPMENT CAN BE BUILT FROM STANDARD RADIO PARTS

power lines, as power engineers need such lower bands for communication. Higher frequencies may radiate and bring stern inquiries from the FBI. Caution: In certain strategic areas, no unlicensed communication whatever is permitted. Therefore, before setting up any equipment, inquire of your local War Emergency Radio Service whether your area is so classified.

The carrier-current receiver is merely a conventional radio, with one difference: it has fixed tuning adjusted to its associated transmitter, since you are interested in getting only that one "station." Construction of this receiver will be taken up in a following article.

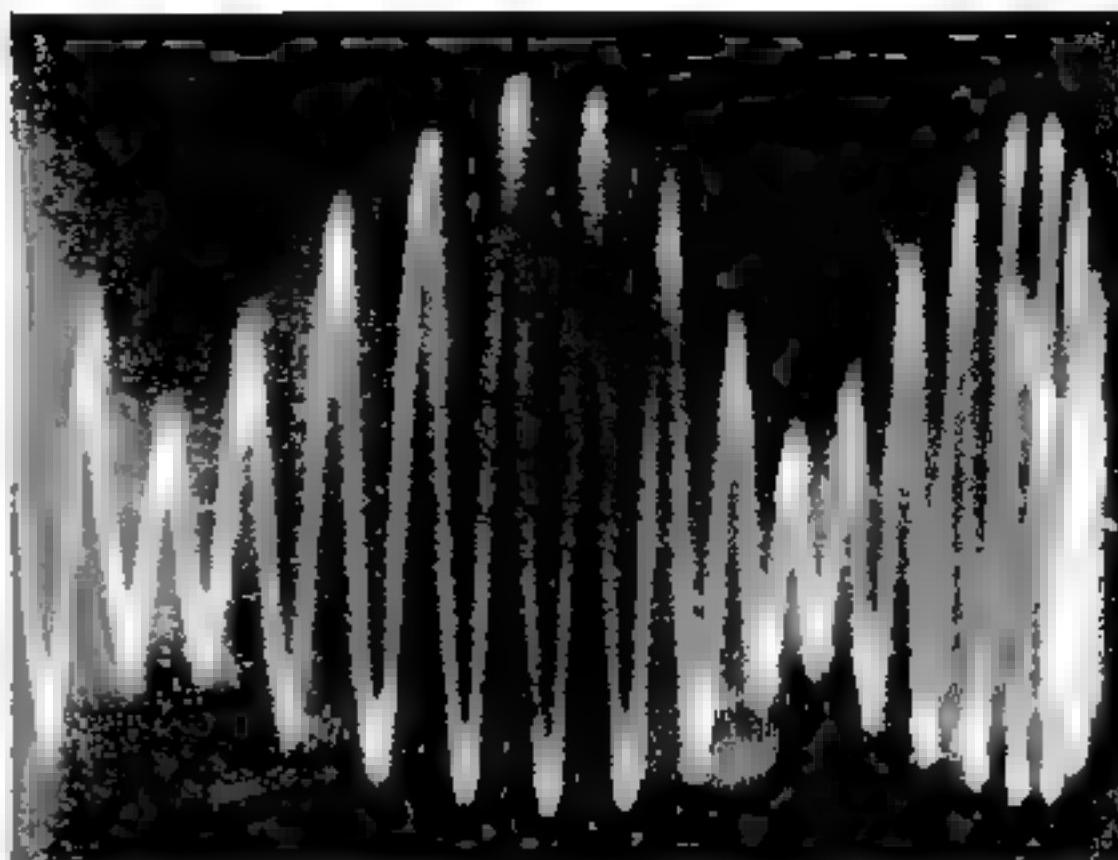

Save that the transmitter is connected to your house power line instead of an aerial, it is just like a low-power radio transmitter. Don't connect it to an aerial. Government monitors are constantly listening for unlicensed stations, so that going on the air will surely get the unwary experimenter into trouble.

Any radio-telephone transmitter consists of an R.F. generator and amplifier and an audio amplifier. The audio amplifier builds up the signal from a microphone until it is capable of modulating the R.F. output, so that the final radio wave varies in intensity according to the variations in sound that reached the microphone. This is standard amplitude modulation, or A.M. transmission.

In the transmitter shown, the A.F. system consists of the 6SJ7, one half of the 6SN7, which is a dual triode, and the 6L6 power tube. The R.F. section consists of the other half of the 6SN7, which serves as the R.F. generator, and the 6V6 power amplifier.

For coil L4, pick the biggest choke coil you have—the one with the largest iron core. It should be designed for no less than a 90-millamp. load, a 15-henry, 120-millamp. choke is much better.

This choke coil causes modulation of the R.F. output. Like any other large inductance, it tends to maintain the flow of current through it at an even level. Both the 6L6 A.F. amplifier and the 6V6 R.F. amplifier are drawing their plate current through it. With no audio signal, the 6L6 draws about 50 millamp. and the 6V6 about 30 millamp.

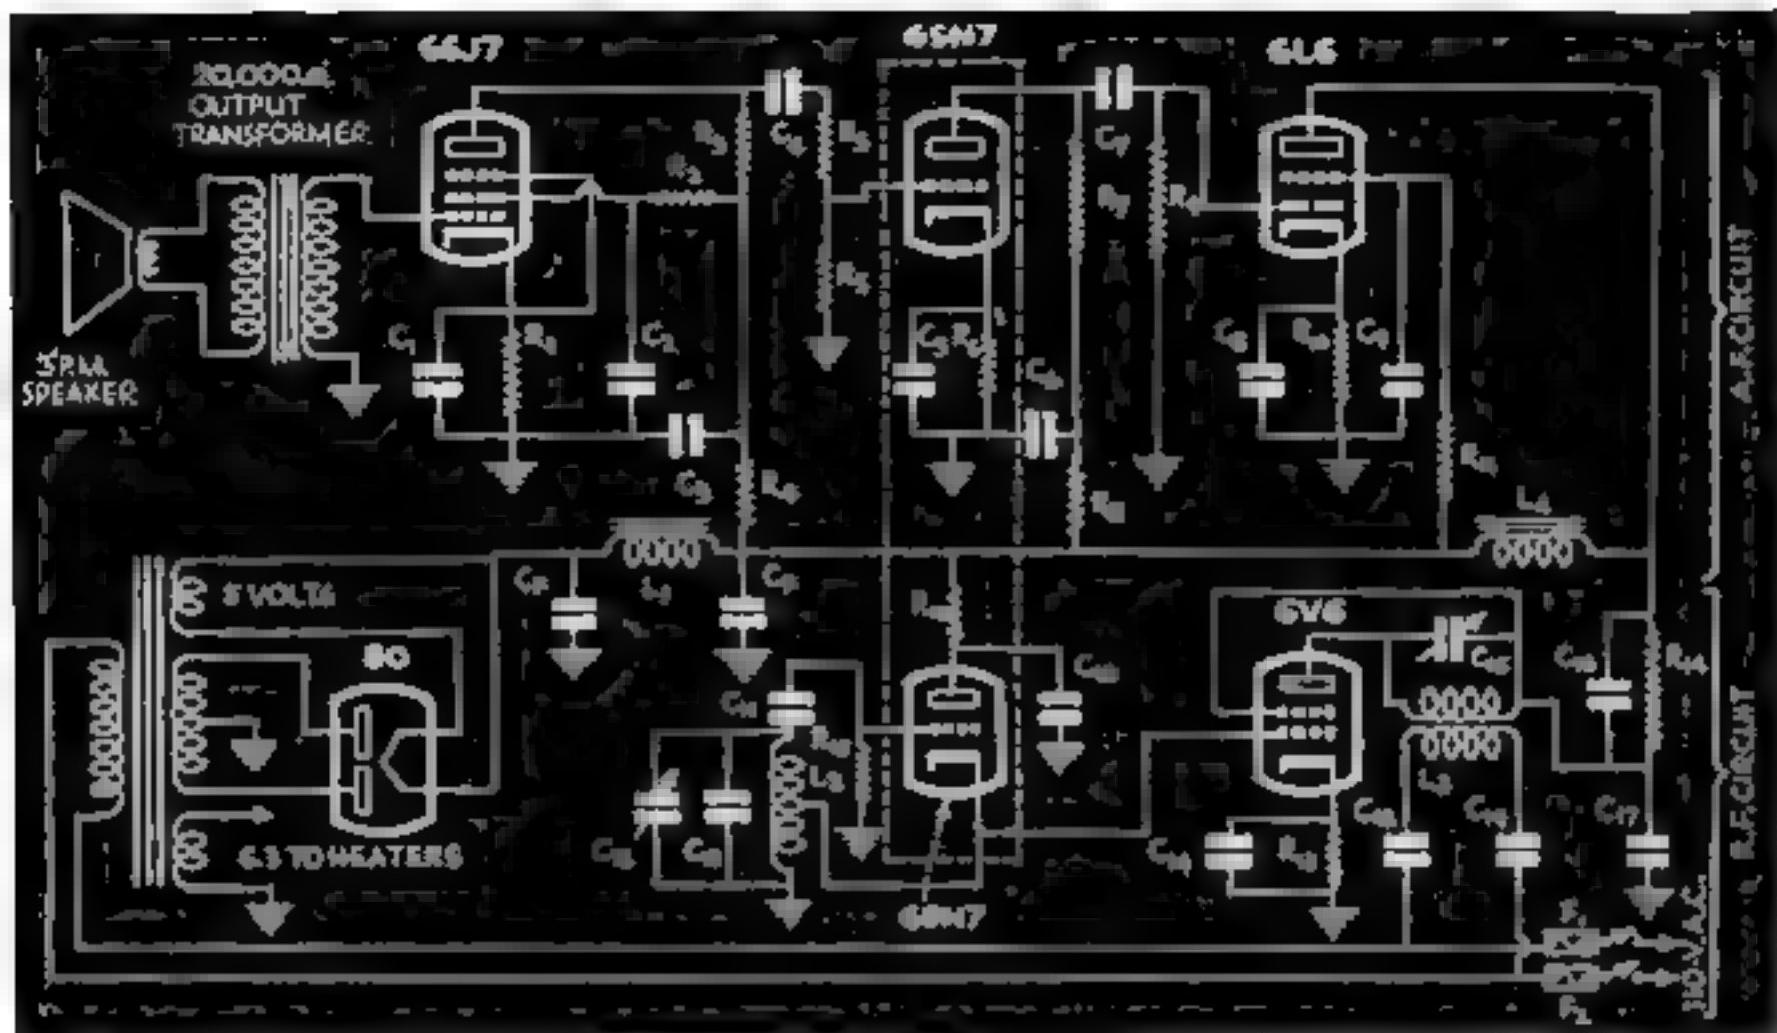

An oscilloscope picture of 180-kc. R.F. waves, amplitude-modulated by 20,000-cycle A.F., a note inaudible to humans

—a total of 80 millamp. flowing in the choke coil. But if an audio signal suddenly causes the 6L6 to draw 80 millamp. instead of 50, the 6L6 will draw all of it and the 6V6 will be starved, since the choke resists any abrupt increase in the total current flowing. As there is no current for the 6V6 plate, the R.F. signal strength will fall to zero. When the A.F. signal swings to negative, it blocks the 6L6 so that this tube abruptly draws no current. Now precisely the opposite thing occurs. The self-inductance of the choke maintains the full 80-millamp. current through it, and all this current is applied to the 6V6 so that the R.F. output skyrockets accordingly.

The A.F. amplifier is a simple two-stage setup feeding a single power output tube. With a 3" permanent-magnet speaker as a microphone coupled through a 20,000-ohm output transformer, full modulation is obtained from normal conversation 20' away.

To prevent pickup of 60-cycle hum by this transformer, it is best to put it with the speaker in a separate case, and to use a shielded microphone cable at least 4' long to connect it to the transmitter.

The oscillator coil for the R.F. circuit of the 6SN7 is a standard 2.5-millihenry R.F. choke with four coil sections or pies. Ground one end and tap the lead between the first and second pies from this end for the cathode connection. With reasonable care

In this circuit a 6SN7 dual triode does double duty, but two separate triodes may be used in the same way

you can lift the wire by using a sharply-pointed pencil. Seal it back with a drop of paraffin when the connection has been made. A 500 to 800-mmfid. trimmer condenser is used to tune the coil to match the receiver; if necessary, a 200-mmfid. fixed mica condenser is added in shunt.

The plate tank coil is homemade. It consists of 100 turns of No. 22 enameled wire close-wound on a standard 1½" form or a 1½" cardboard tube saturated with paraffin. The secondary coil is six turns of No. 18 wire wound over a layer of insulating cambric or wax-soaked wrapping paper around the center of the primary.

Once the transmitter is connected to the power line, strict caution is in order. You are not working with the R.F. voltage common to receivers, but with about 600 volts of R.F. energy. It bites. It has a tendency to reach and painfully nip unwary knuckles, carrying 300 volts of D.C. along with it. *'Hands off'* is the only safe rule so long as the chassis is operated outside its cabinet.

A neon bulb held close to the tank coil will light up readily by reason of radiated R.F. energy. Similarly, enough voltage can be induced in even a 1" length of wire to cause feedback and start unwanted oscillation. Therefore, put a single ground lug near each tube socket and make all ground connections relating to that tube to that one lug.

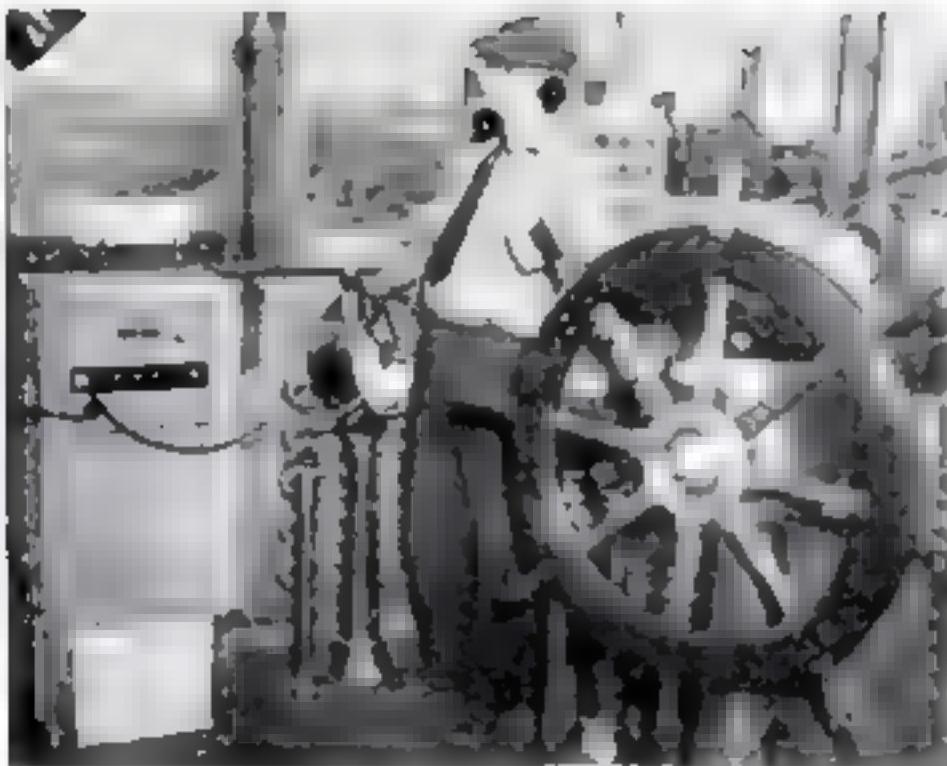

If the builder wants to use the outfit from his house to a certain other one, it may pay him to first investigate the power hook-up between them, as results from any

carrier-current communicator may be somewhat unpredictable. For example, it may work well to a house three blocks away and not at all to another across the street. One reason for such irregular operation may be that the nearer house derives its electricity from another distribution transformer.

(To be concluded)

SHIP-TO-SHORE F.M. RADIO has been given extensive tests on the Great Lakes, six transmitter-receiver units being put in operation on car ferries, fishing tugs, and

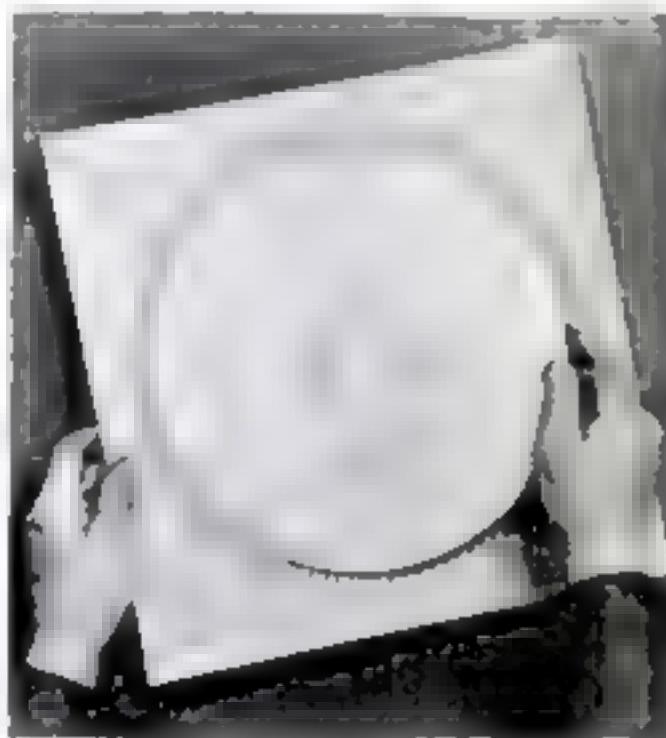

cargo vessels for a period of 90 days. The entire equipment, with the exception of the power source, is contained in a single cabinet, one of which is shown at the left in the photo. All that is necessary to get in touch with a shore station to report information or to receive instructions is to lift the telephone-like receiver and to call the station signal.

The tests were conducted by the Lorain County Radio Corporation, of Port Washington, Wis., and engineers of the General Electric Company. An F. M. transmitter-receiver is shown in use by Acting Captain Walter Dummer aboard the Great Lakes car ferry Madison.

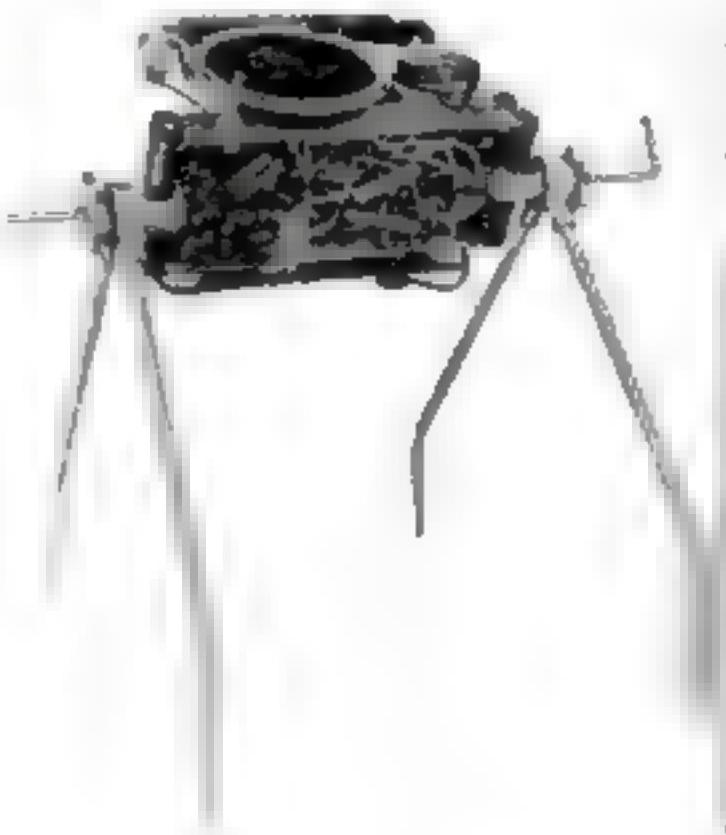

PORABLE-RADIO "MIKES" designed for police and airport communication and public-address systems have been put on the market by the Electro-Voice Corp., of South Bend, Ind. They are ruggedly built for use in temperatures ranging from 185 deg. to 40 deg. below zero.

TUBE-BASE CONNECTIONS for more than 300 tubes are readily found on the dial selector shown at right. A turn of the dial to put the arrow opposite the desired tube type in the outer circle shows filament, grid, plate, and cathode connections and other information in the openings, along with the number of each connection on octal sockets.

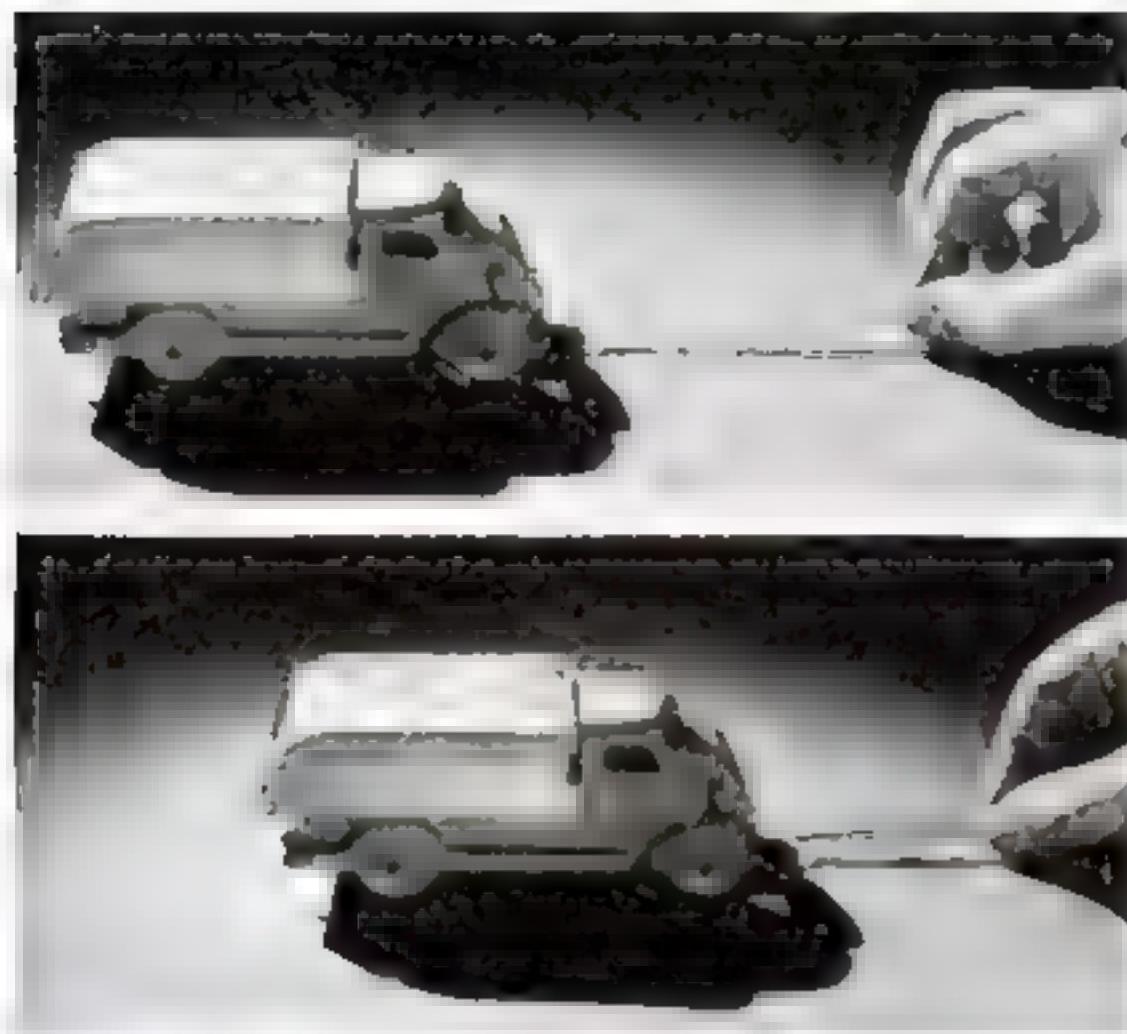

ASSEMBLY, INSPECTION, AND REPAIR are facilitated by a new chassis cradle that permits locking of a radio receiver in any position. Both hands of the serviceman are thus left free for the job without danger of dropping or bumping the receiver. The cradle, set on legs, is made of cadmium-plated steel and white metal by the Aero Tool & Dye Works, of Chicago.

PHOTOELECTRONS FROM THE MOON are believed to affect radio reception as a result of data obtained from 20,000 hours of observation over two periods of four years each. According to a report to a General Electric Science Forum by Dr. Harlan True Stetson, of Massachusetts Institute of Technology, radio reception was best from the first quarter to the full moon and also from the last quarter until shortly before the new moon. Observations made in the dark of the moon—that is, when no radiations reflected from the moon could reach radio waves on the path under study—showed no such variations in the quality of reception.

HOME EXPERIMENTS

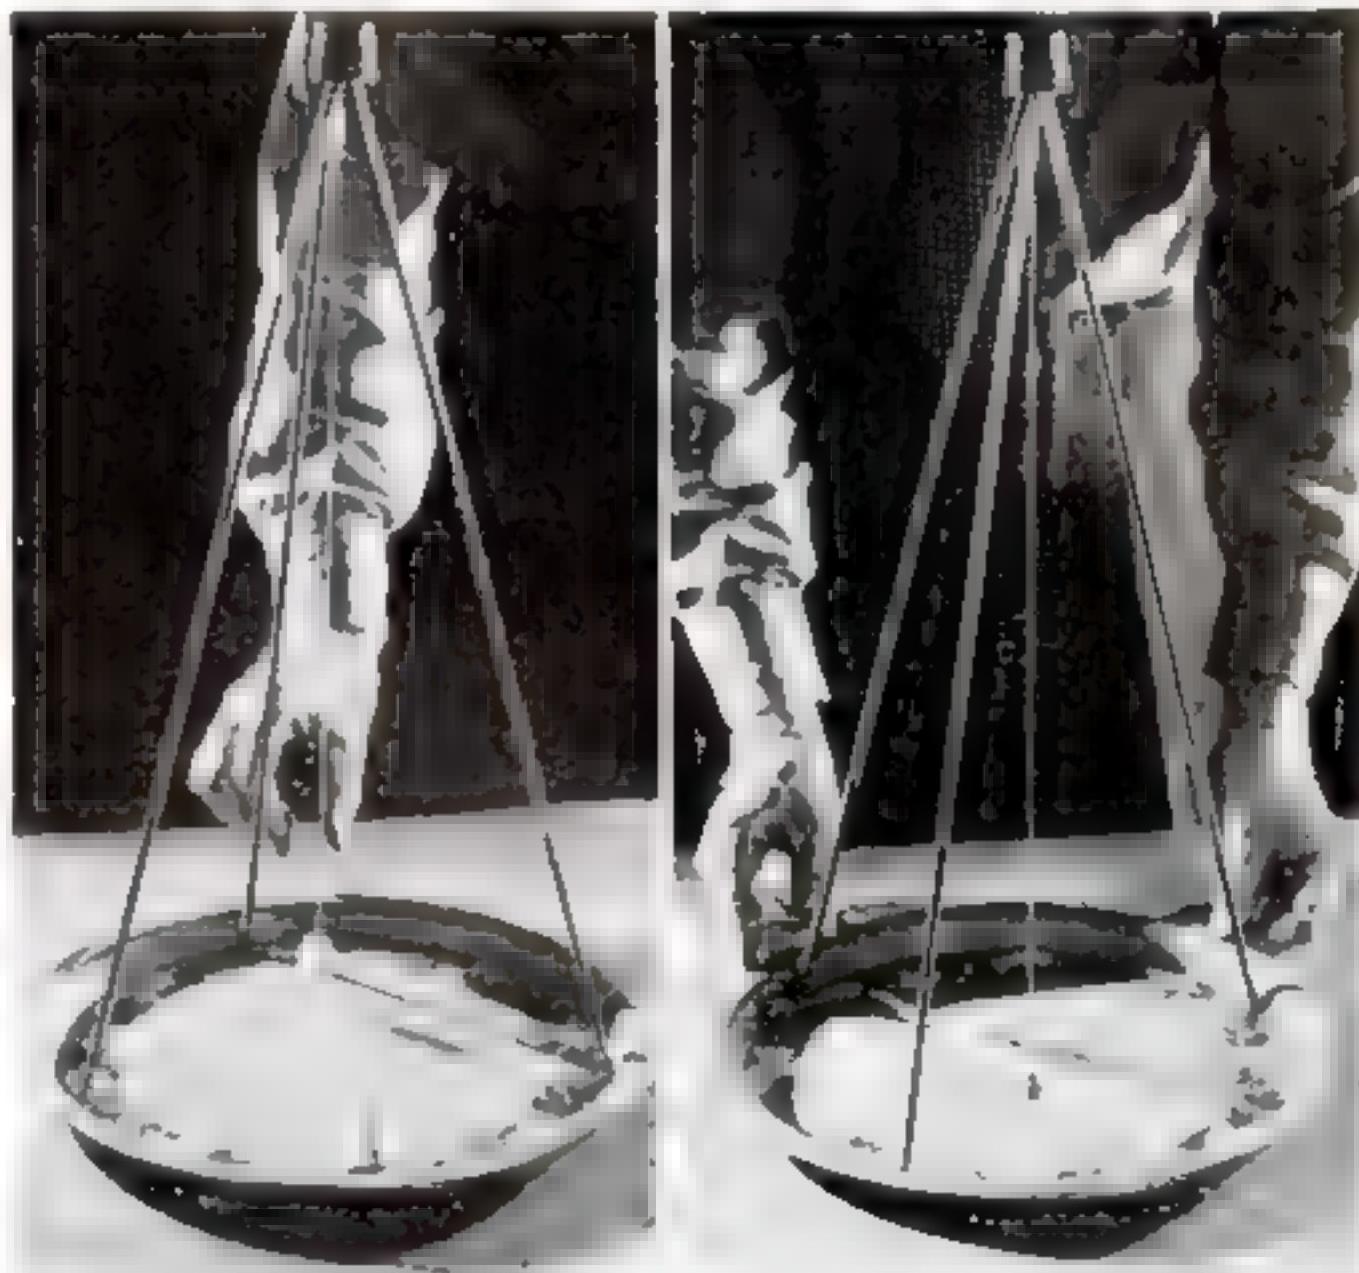

WHY MORE POWER is needed to start your car than to keep it going at moderate speed may be shown by pulling a loaded toy truck by means of a rubber band. The rubber stretches far less once the toy truck is in motion than it does when you attempt to get it started. This is because inertia and static friction both act to resist motion when the truck, or your car, is standing still. Considerable force is required to overcome friction of parts not moving in relation to each other (see P.S.M., Jan. '45, p. 203). Inertia, which causes an object to resist changes in speed, calls for application of force to attain a desired speed. Because of inertia, force must also be applied, as by brakes, to stop in a short distance a car already in motion.

THAT A PENDULUM swinging freely tends to remain in the same plane can be demonstrated with the simple setup shown here. This experiment was first made famous by the French physicist Foucault in 1851 when he suspended a heavy copper ball by a long, thin wire from the dome of the Pantheon at Paris. Once the pendulum was set in motion, its oscillations seemed to rotate in clockwise fashion in relation to the floor of the building. Foucault demonstrated mathematically, however, that what was really being observed was the rotation of the earth beneath the pendulum.

At the North and South Poles the pendulum would seem to reverse itself completely every 24 hours, while at latitudes between them the turning would be correspondingly less. Only at the equator would the pendulum swing without seeming to rotate.

With a marble suspended from a tripod by a thread, the demonstration can be given in

miniature. Start the marble swinging over a path marked on a tray. Then, to represent the rotation of the earth on its axis, turn the tray slowly, and the relation of swing to the marked path changes. The plane of the swing remains constant.

SHOW LAWS OF MECHANICS—

SIMPLE LEVERS assist in the performance of many tasks. In everyday life the can opener, the oar, the shovel, the scissors, the crowbar, and the human arm are examples of devices using the lever principle. An effort exerted at some point on a lever having a fulcrum has an effect on a resistance at some other point. If the distance between fulcrum and effort is greater than that between fulcrum and resistance, we gain the mechanical advantage of force; in the reverse, we get speed or distance of travel.

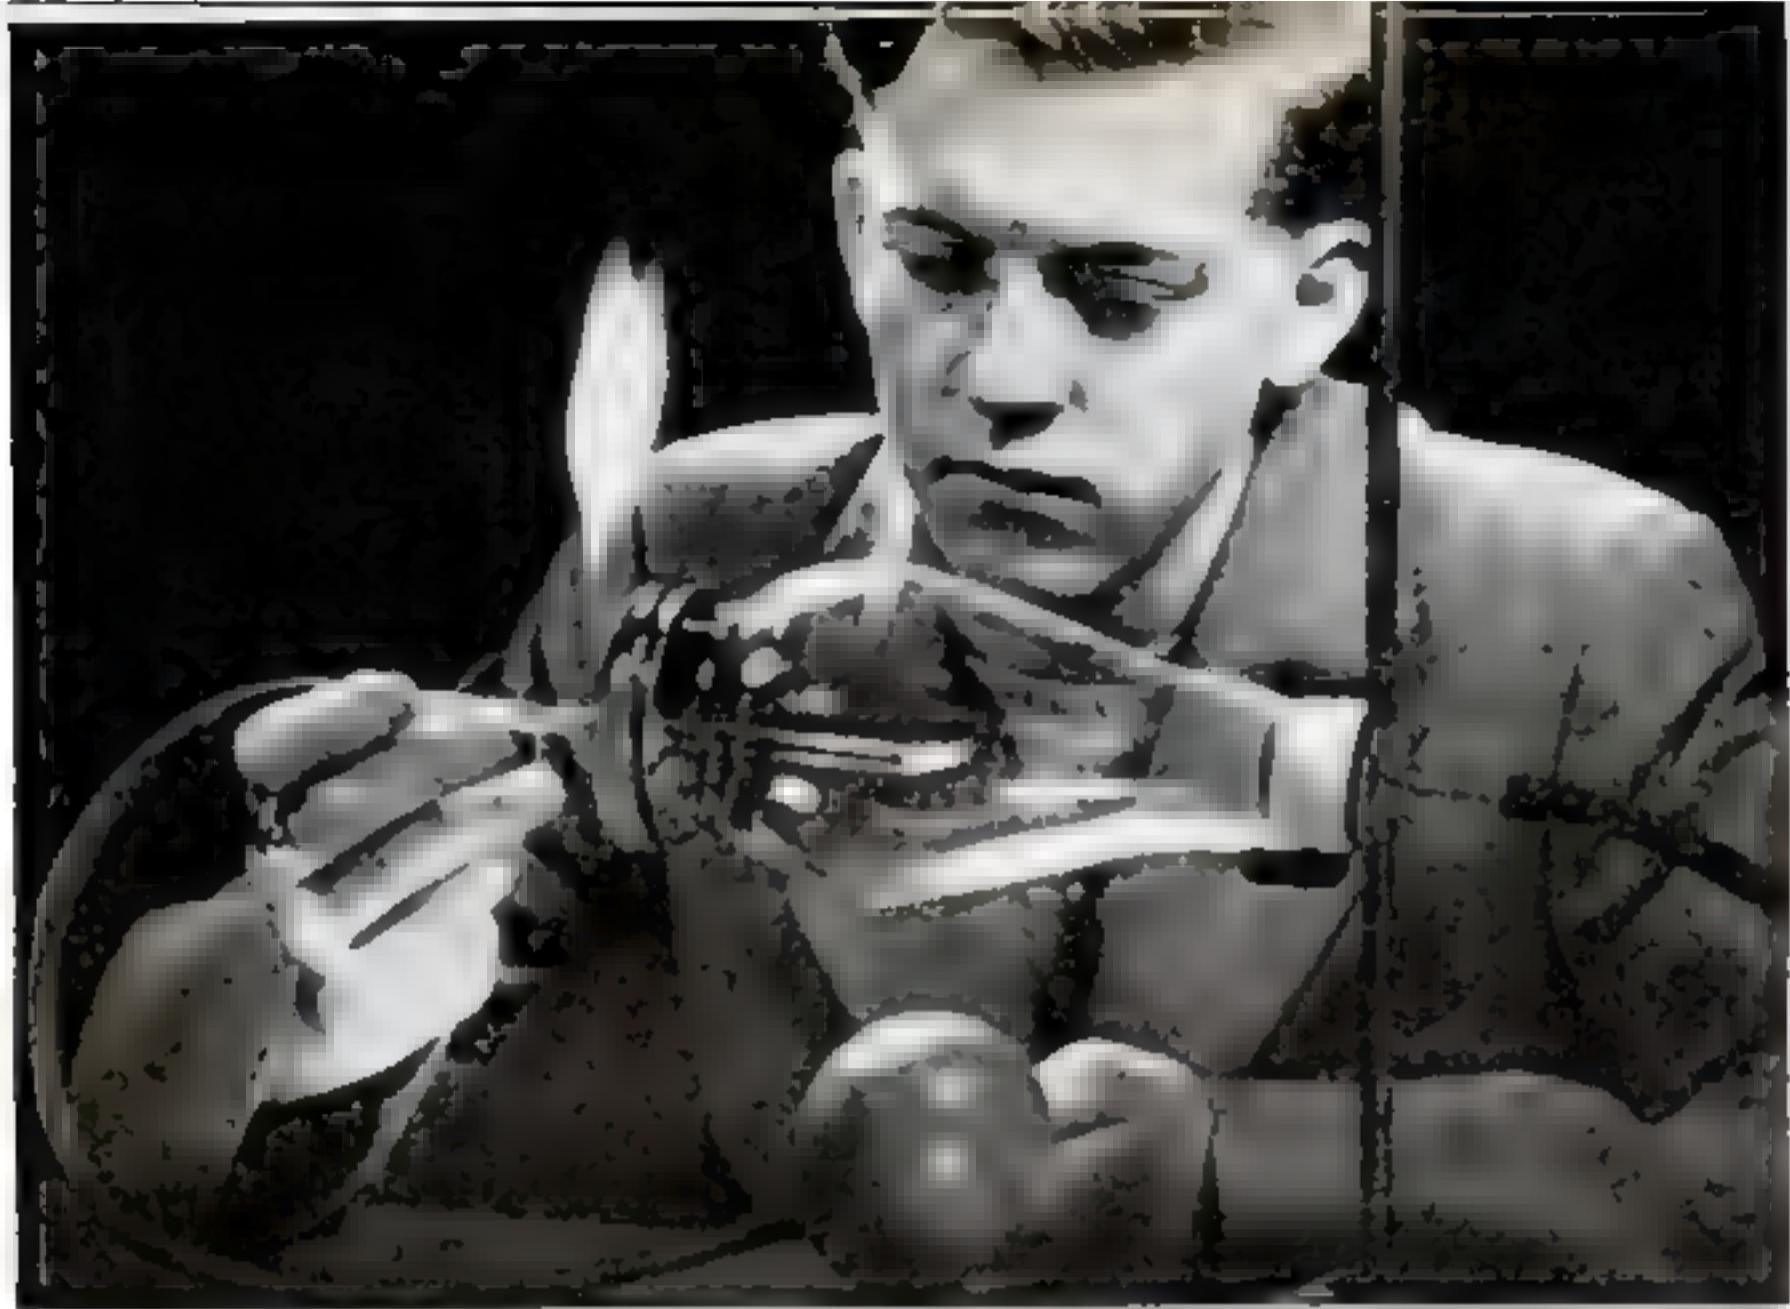

Make a simple lever of an 18" ruler resting on a pencil for a fulcrum, and set a glass of water on one end. With the fulcrum near the glass, you can raise the weight simply by blowing on the far end. Put the fulcrum 1" from the far end, though, and you won't be able to budge it.

POTENTIAL ENERGY is given to an object merely by lifting it, and in the pile driver this energy is harnessed to do useful work. Make a miniature pile driver from a 12" or 18" glass tube or ordinary mailing tube and an iron or lead weight fitting in it loosely and held by a string. Center your pile driver over a small flathead nail barely started in a piece of soft wood. You can drive the nail in by repeatedly dropping the weight. This energy is measured in foot-pounds, the product of the weight multiplied by the height.

WHICH FALLS FASTER, a ruler or a coin placed at one end? If you drop the ruler altogether, both fall with the same speed. But if you hold onto one end of the ruler, the end you release drops faster than the coin—you can hear the click as the coin hits last. Thus held, the ruler becomes a pendulum, and its center of percussion (two-thirds down from its supported end) falls at the acceleration of gravity as does the coin. The free end of the ruler actually falls faster.

Illuminating gas, issuing from the chimney, burns in air, while inside the chimney, air passing from the balloon through the glass tube burns in gas. It is ignited when the tube is pushed through the flame

The Chemistry of Fire

WHEN MAN LEARNED HOW TO CONTROL COMBUSTION, HE WON
WHAT BECAME THE ALADDIN'S LAMP OF CIVILIZATION

By Kenneth M. Swezey

If YOU call the genie of Aladdin's lamp fire, or combustion, you have something much more remarkable than a mere fairy tale. Fire, intelligently controlled, is certainly the chief wonder-working servant of civilization. Look into many of the essentials of modern life—such as heat, food processing, manufacture, chemical synthesis, and steam and gasoline transportation—and you will find fire to be the magic source of all these wonders.

So universal is the knowledge and use of fire that no one knows when or how it was discovered. Thousands of years ago it was considered one of the four elemental building blocks making up the world. As late as the eighteenth century, the phlogiston theory defined fire as a material in combustible substances that left them when they burned.

It was not until the 1770's that the real

secret of combustion was learned. The French scientist Lavoisier, discarding the speculations of his predecessors, buckled down to careful experimentation. By precise weighing and measuring of all the products that resulted from combustion, he discovered that they weighed more, not less, than the substance burned. Then fire, or combustion, he reasoned, was not the result of a sundering of substances but a union of them. In all cases he tried, Lavoisier found one of the substances present was a gas, recently discovered by Priestley, which Lavoisier named oxygen.

Today we say that combustion is the effect produced by the violent union of two or more chemical substances generally accompanied by light and heat. Usually one of the substances is oxygen, but now it is recognized that oxygen need not always be present—other substances may combine to produce an effect that must be included under the present definition of fire.

Sulphur and iron, for instance, produce light and heat when they combine, and they do so without the help of oxygen. Mix equal parts of powdered sulphur and iron filings, and put 1" of the mixture in a hard-glass test tube. Heat the bottom of the tube strongly over a Bunsen burner, and presently the whole mass will glow, the glow continuing even after the heat is removed. The result of the combination is iron sulphide, a chemical which may be of use to you in future home experiments.

Fire, or combustion, as we ordinarily recognize it, is the result of the rapid combination of oxygen with a combustible substance. Although we usually think of the combustible solid, liquid, or gas as being burned, oxygen plays an equal part. To prove this, you can perform a simple experiment in which air, or oxygen, can be made to burn in an atmosphere of illuminating gas—reversing the customary method of burning gas in air.

Mount horizontally a lamp chimney, or a bottle with its bottom cut off. Then connect a glass tube through a one-hole stopper to a rubber tube leading to a supply of illuminating gas, and insert the stopper in the small end of the chimney. Hang loosely over the other end a jar cover having a $\frac{1}{8}$ " hole in its center. Fit a 10" glass tube to 12" or so of rubber tubing which is connected to a toy balloon with a pinch clamp to cause air to flow through it slowly.

Turn on the gas and, after allowing 10 or 15 seconds for it to flush the air from the chimney, ignite the gas issuing from the hole in the jar cover. Reduce the flow to get a flame 2" or 3" long. Now introduce the glass tube, air flowing through it gently,

Held in a flame that is getting sufficient air for complete combustion, a cold porcelain crucible will not smoke up, but in a flame not getting enough air, it collects black, sooty carbon, as shown at right. Readjust the burner to give the flame air, and it will quickly consume all the carbon on the crucible

into the chimney. The air must flow slowly and steadily for best results. As the tube passes the lighted gas on the outside of the chimney, the air coming through it will ignite, and this flame can be carried far into the chimney. It is an example of reciprocal combustion—air burning in combustible gas.

Illuminating gas, fuel oils, and candles are composed chiefly of complex mixtures of carbon and hydrogen, and during combustion they are decomposed. If sufficient air cannot enter into the reaction, solid particles of incompletely burned carbon are released. The glow of these particles produces the opaque yellow flame of candles, old-fashioned gas jets, and Bunsen and gas-range burners in which the air supply has been reduced.

When gas jets were a source of light, luminous flames were practical. In modern heating systems, however, they are sometimes the result of inefficient adjustment, and they mean soot and wasted fuel. You can show this with your Bunsen burner and a cold porcelain crucible or some other cold object. Cut off the air supply of the burner, and the yellow flame will smoke up the crucible in a few seconds. But if the burner is properly adjusted to admit sufficient air, the flame will not only not smoke up the porcelain, but it will actually burn off accumulated soot and leave the crucible clean and white.

An interesting stunt will demonstrate the comparative coolness of a candle flame. Scrape off the insulation of some bell wire and make a little copper coil by winding 10 or 12 turns around a pencil. Lower this coil over a candle flame, and the flame will go

Candle flames are comparatively cool and can be extinguished simply by taking heat away faster than it is generated, as shown at left where a copper coil is used. At right, carbon disulphide bursts into flame as a heated rod is brought near

out to the depth you lower the coil, heat being taken away faster than it can be generated.

Fortunately, oxidation violent enough to be called combustion does not occur to most substances until they have first been subjected to considerable heat. The temperature required depends upon the substance, the state in which it is divided, and the possible presence of catalysts that might aid oxidation. A few substances like lime (calcium oxide) and asbestos (a fibrous silicate mineral) do not burn in the true sense no matter how high the temperature. Simple oxides and certain other compounds already contain their maximum amount of oxygen.

The temperature needed to start combustion is the "kindling point." Substances with low kindling points are fire hazards and should be handled intelligently. Yellow phosphorus, for instance, ignites spontaneously in air at room temperature, and when not in use it must be kept under water.

Many volatile liquids may catch fire without actual contact with flame—a few without contact with any visible source of heat. If you use caution, you may demonstrate this without danger. Pour a very small amount of carbon disulphide on a little cotton wad in a jar cover, taking the precaution to keep at least 20' from any open flame while handling this highly inflammable liquid. If possible, perform the experiment in the open air or on an unenclosed porch. Heat an iron curtain rod or a heavy iron wire red hot in a Bunsen flame, remove it, let it cool until the redness just disappears,

and then quickly hold the rod close to the top of the soaked cotton. The carbon disulphide will burst into flame.

Exercising the same caution, repeat the experiment with such liquids as ether, benzine, and alcohol. The temperatures at which they ignite can be compared by the redness of the rod. And one important lesson will be learned: *Many common solvents are highly inflammable and should always be handled with care!*

Some substances not ordinarily combustible may be made to burn by uniting them in certain combinations and under certain conditions. Sand and carbon tetrachloride are used for extinguishing flames, and a piece of zinc is nothing with which to kindle a fire. But mix equal parts of fine sand and zinc dust, put a little in a metal bottle cap, heat it over a small flame, and add a few drops of carbon tetrachloride.

You will get fire and clouds of smoke. The combination is a smoke-producing agent in warfare.

What happens is a complex reaction. The heated zinc combines with the carbon tetrachloride to form zinc chloride and particles of carbon. Vaporized by the heat, the zinc chloride then reacts with the moisture in

Sand, zinc dust, and carbon tetrachloride do not ordinarily burn, but mix them properly and they give off a dense smoke like that used in warfare

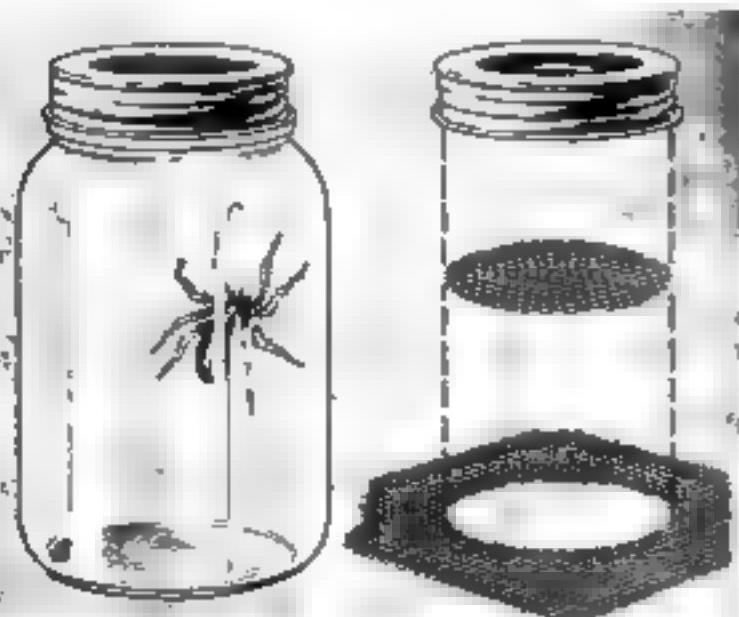

the air to form white zinc oxide, and this, mixed with the particles of black carbon, makes the dense gray smoke.

Occasionally substances packed with oxygen react so strongly with certain other substances that they generate internally enough heat to produce combustion. Powder several grams of potassium permanganate and place in a jar top on an asbestos pad. Make a little depression in the center of the powder, add just three or four drops of glycerin, and stand back at once. The mixture will sputter and soon burst into a dazzling white flame, as at the right, giving off volumes of smoke.

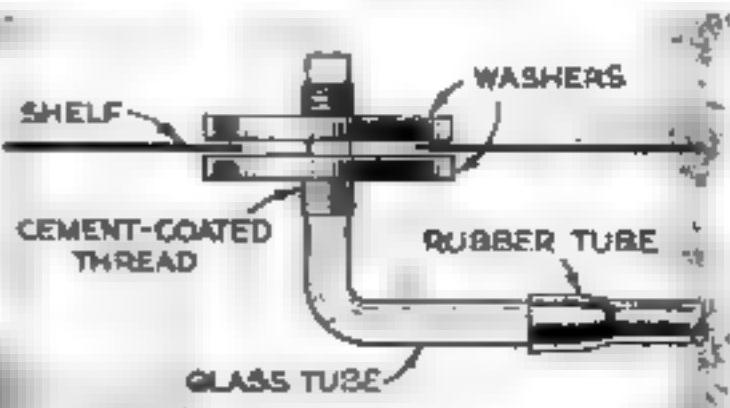

LIVE INSECTS can be kept in a Mason jar of the type having a two-piece cover if it is fitted as shown below. Replace the flat disk in the cover with a circular section of screening, cut to fit snugly in the ring.—KENNETH MIDDLEHAM.

BOTTLED CLOUDS are used in the Westinghouse Research Laboratories for testing insulating materials to go into new bombers. Made from liquid air and warm water by Arthur M. Stiles, research engineer, these artificial clouds are introduced into sealed flasks in which the materials are then tested for resistance to dampness occurring under various atmospheric conditions. Besides simulating actual clouds, the air-water combination in these flasks, or "altitude chambers," can be made to present many other forms of natural precipitation. When a flask is cooled below the freezing point, tiny snowflakes collect on the materials as they would in a snowstorm.

GLASS TUBING can be attached to the shelf in a pneumatic trough by a simple, nonslip method. Two washers having an inside diameter just large enough to take the tubing are used, one above the shelf and one below it. The hole in the shelf is smaller than the outside diameter of the washers. Slip the tubing through the washers and seize it with thread as shown. Then coat the seizing with cement—RALPH REHM.

Electrically Cut Bottles

Battery Jar

Fish Bowl

Chemical Tank

By HAROLD P. STRAND

YOU can make many useful containers from glass bottles or jugs simply by cutting off the necks and, sometimes, the bottoms. An electrical-resistance hookup provides the best method of cutting such a utensil without shattering it.

Wrap a length of adhesive tape around the jug at the point where the sides start sloping in to meet the neck. Using a sharp glass cutter, scribe the jug along the top of the tape, as in Fig. 1. Wind a single turn of resistance wire, preferably 24 gauge, around the jug on the scribed line, bringing the ends tightly together and holding them with a piece of asbestos-covered solid wire.

A heavy-duty lamp cord is used to transmit the necessary current. Separate the two wires and splice one directly to the resistance wire. Connect the other to a resistor of about 20 ohms that will carry 5 amperes. A toaster or a flatiron is good, or you can use a replacement element intended for use in such an appliance. Fasten a length of

insulated wire to the other end of this resistor and scrape the insulation off the free end of the wire for a distance of about $\frac{1}{8}$ ".

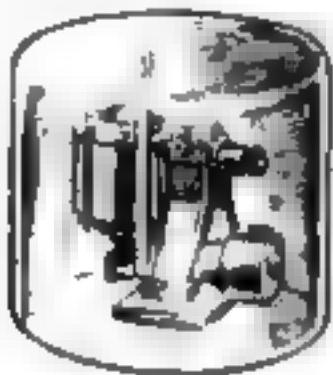

Now touch this wire intermittently to the free end of the resistance wire that is wrapped around the jug. The latter will heat up—don't let it get beyond the point where it glows dull red. After a few applications of the current, a cracking sound will tell you that the heat is starting to separate the glass along the scribed line. If the wire fails to heat enough, check on the wire and resistance; with a 660-watt resistance element, use 24-gauge wire, and with a 1,000-watt element, use 20 gauge.

Help the cracking process by tapping the glass with the ball end of the glass cutter. If the resistance wire slips out of place while power is being applied, anchor it with three or four tabs of adhesive tape, spacing them equally around the jug. These may scorch, but the scorching won't affect the glass. When the cracking process is completed, the top section of the jug can be lifted off as shown in Fig. 3.

There are at least two methods of finishing the cut. One way is to remove the tape and carefully to file down the sharp edges. Another and better way is to bind the top with waterproof adhesive tape. Apply two

Form Unusual Containers

Model Case

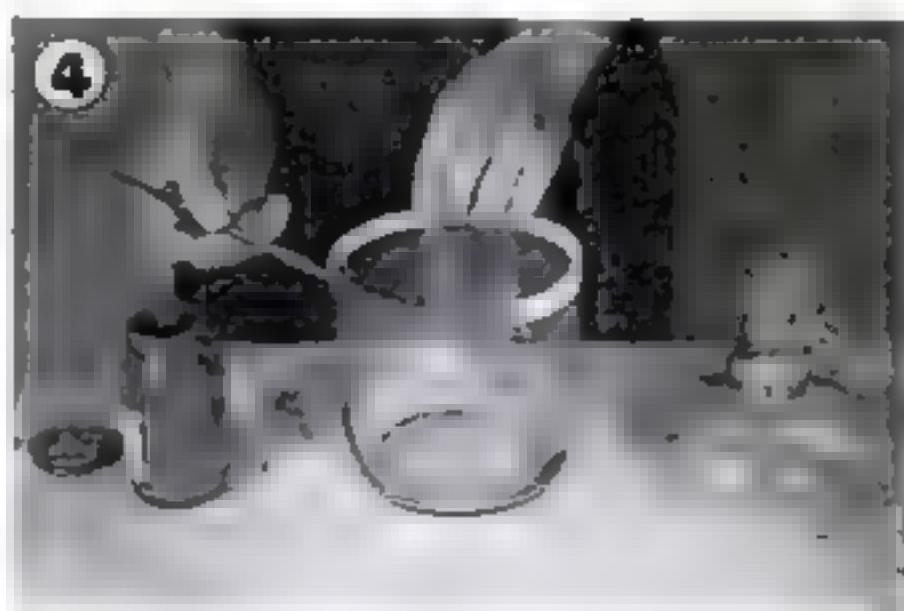

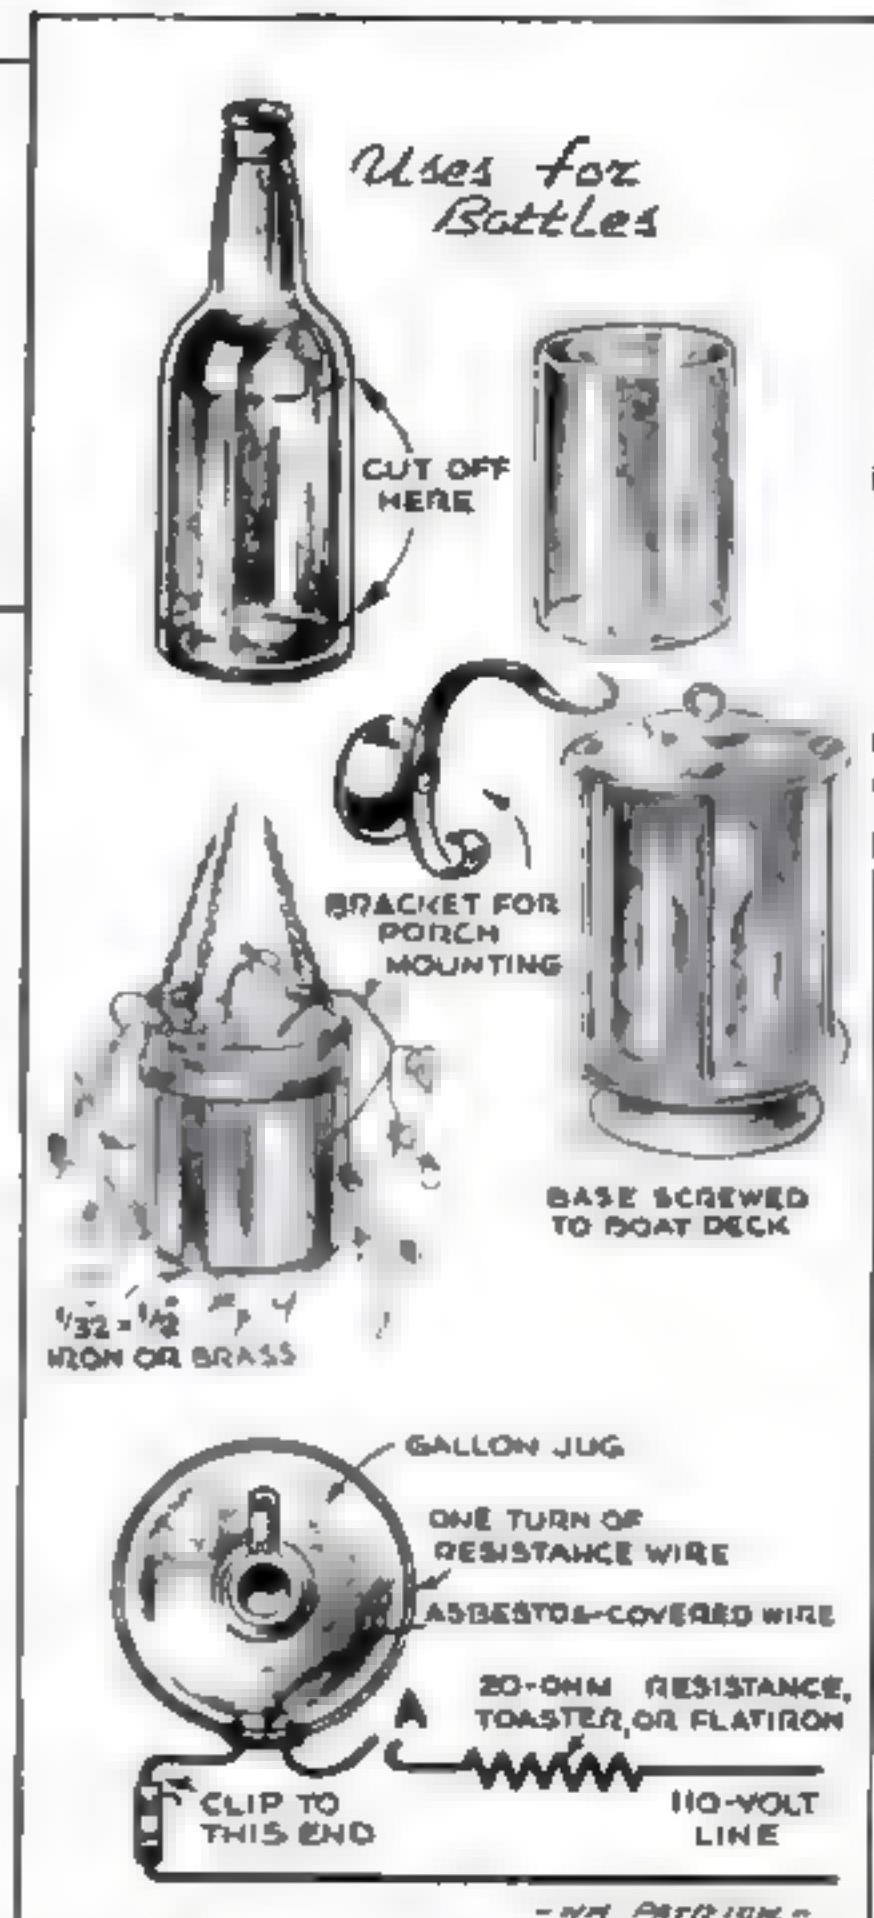

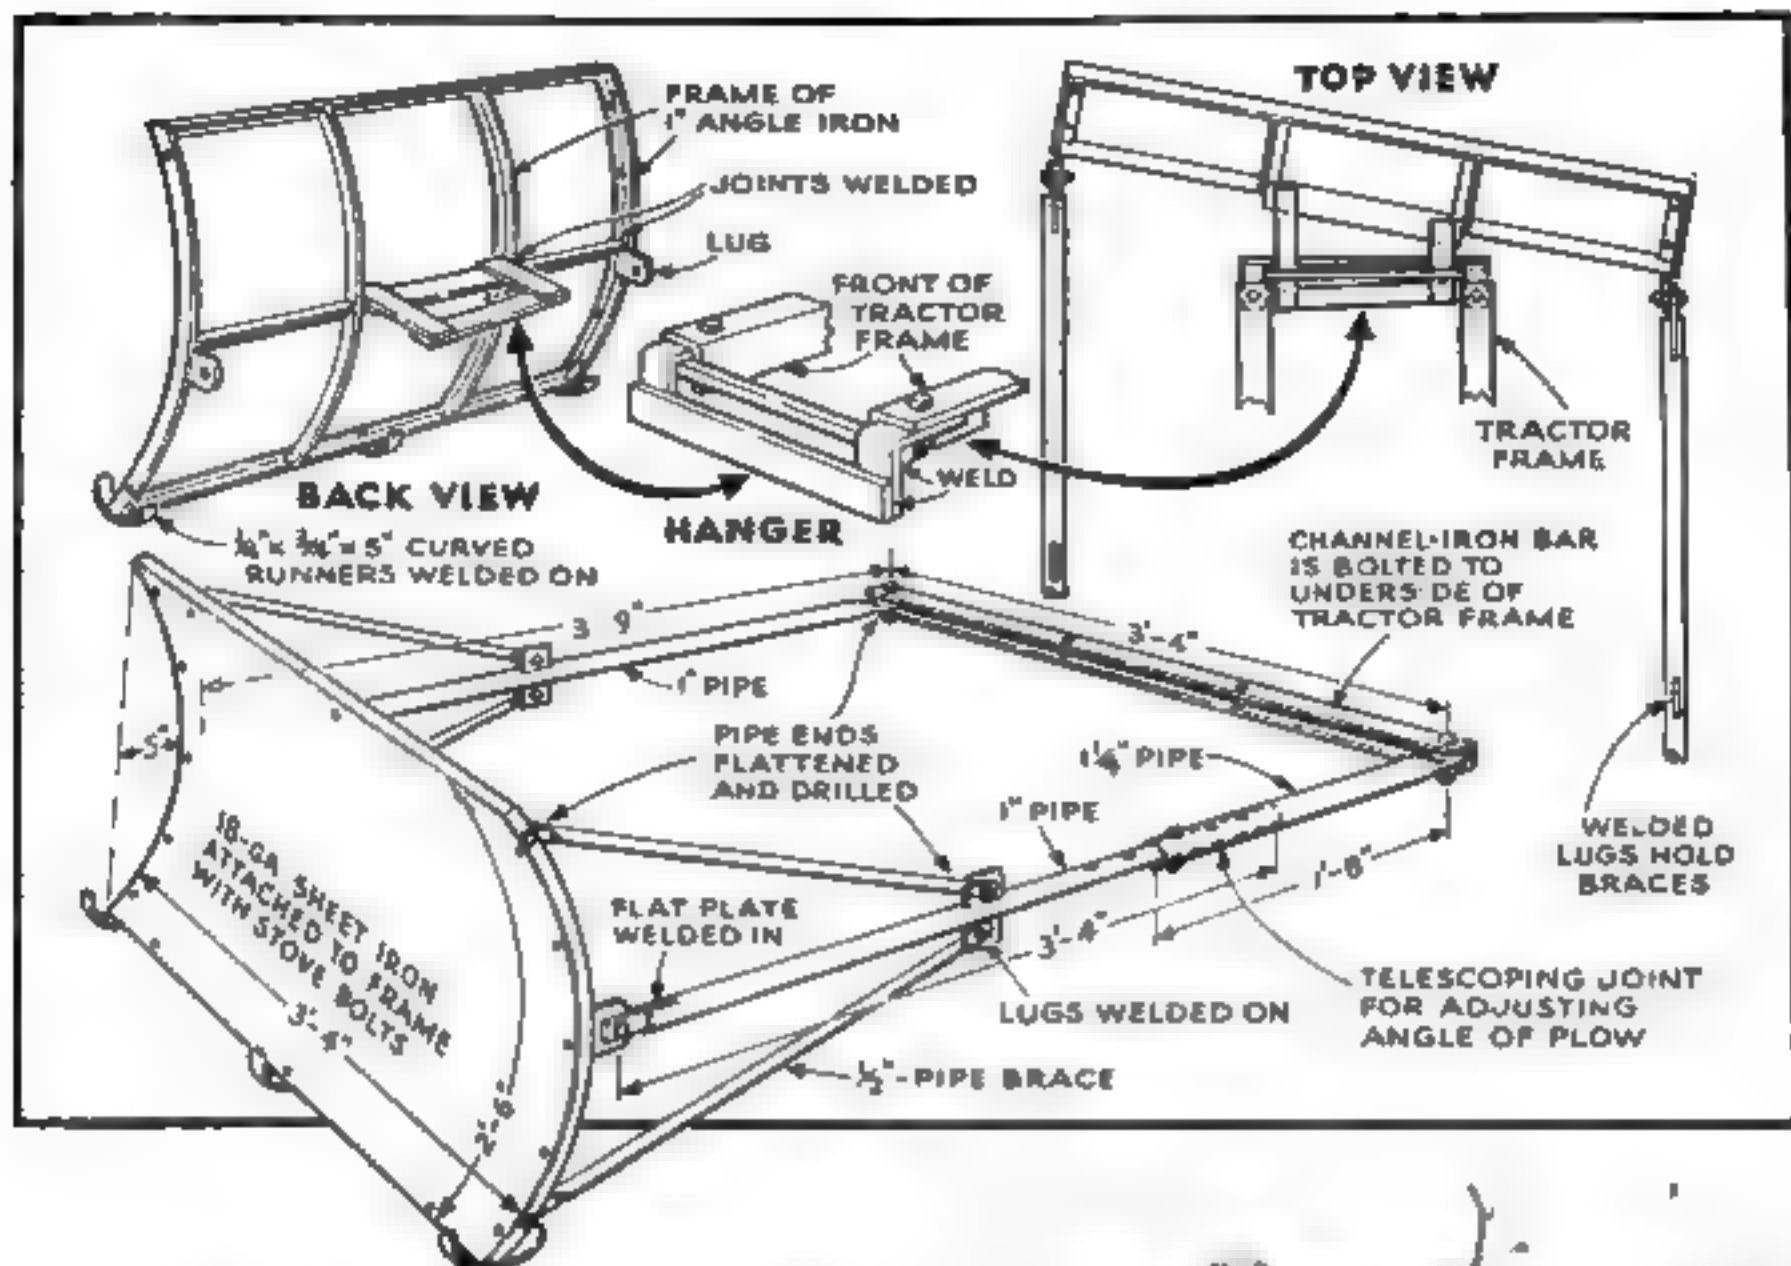

Instrument Cover

coats of waterproof lacquer to the tape, as shown in Fig. 4.

The finished product will have a capacity of about three quarts. You can use it as a wet-cell jar, a fish bowl, or a chemical tank, as shown in the drawings above; or employ it in your shop to hold metal-pickling acid; or turn it upside down and use it for a model case or a cover for your microscope or chemical balance. If you make a dust-resistant lid for it from two wooden disks nailed together, the lady of the house can use it when she cures or pickles foodstuffs. One disk should be slightly smaller than the inside diameter of the jar, the other should equal the outside diameter.

A bottle of the sort that is shown at the upper right, cut as indicated, can be used as the glass cylinder in a marine-type lamp. Make the top and bottom pieces of the fixture from hardwood or metal. Hold the assembly together with four bolts made from $3/16$ " brass rod. For use on a porch, hang the lamp from a wall bracket; on a boat, screw the base to the underside of the overhead deck. A similar bottle can be adapted for use as a hanging plant container, as shown in one of the accompanying drawings, by making a cradle for it from three pieces of $1/32$ " by $1\frac{1}{2}$ " iron or brass strap.

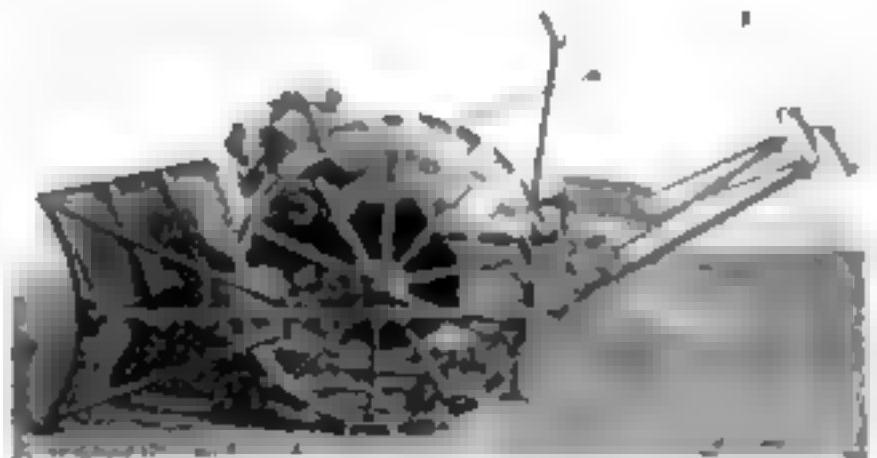

Garden Tractor Is Converted to Snowplow to Clear Walks

GARDEN tractors can be made to do double duty by using them in the winter months to remove snow from sidewalks and driveways. The one shown works well even in snow of considerable depth, for the steel wheels, fitted with diagonal lugs, have little tendency to slip and spin.

It will be noted in the drawing that, although the 1" pipe frame of the plow surrounds the tractor, some thrust may be transmitted through a bracket and hanger attached to the plow and to the front of the tractor frame, respectively. One of the side members is constructed with a tele-

scoping joint and removable pin so that the angle of the plow blade may be adjusted to suit different conditions. As a rule, the deeper or heavier the snow, the sharper this angle should be.

The dimensions given in the drawing are for a 4-hp. tractor; if one of less power is used, the blade should be made somewhat narrower.—RALPH S. WILKES.

Rotating Fixture with Treadle Permits Continuous Welding of Round Work

CONTINUOUS welding of cylindrical objects such as steel drums or hot-water tanks is made easier with a fixture of the kind shown at the left, suggested by the Linde Air Products Company. The sash cord should be just long enough to let the weight touch the ground when the treadle is up. As the welder slowly depresses the treadle, friction of the cord will cause the work to rotate toward him. When he raises his foot the weight will pull the cord back, but the work itself will not roll back.

I Ride "the Beast"

(Continued from page 133)

up enemy task forces. It worked in the Battle of the Coral Sea, at Midway, Guadalcanal, and Rabaul.

On sea targets we would dive on anything the Japs were foolish enough to put in our sights. The fighters would strafe the decks, then fly cover above us. Below us the torpedo planes would sweep in and administer the *coup de grace* after we had our targets dead in the water.

Against land targets we would use substantially the same tactics. Land targets were easier. They didn't move. There we would get in the best licks with our wing guns.

The first objective of the task force to which we were attached was Saipan. The Marines were to take Guam. This was D-day minus 3, and our job was to soften up the defenses. We also were to help neutralize Jap air power in the area.

We hit Guam. Orote peninsula crawled with Jap antiaircraft emplacements. They were hard to see from the altitude at which we "pushed over"—that is, where we went into a shallow dive. Usually it wasn't until we were halfway down that we spotted the AA "winks." Then we would have to go on very low into a rain of automatic-weapons fire to put our bombs where we wanted them.

We used the cannon to start fires.

Our force pulled away and cruised north to hit the Bonin Islands to neutralize the Jap bases there and prevent interference with our investment of Guam.

When we came back, a strange show was going on. Without risk to their carriers (they thought), the Japanese were launching hundreds of planes against us. Their idea was simple. It was good. It just didn't work. The Jap planes were to shuttle-bomb—plastering our invasion forces and then flying on to Guam. There they were to refuel, rearm, and plaster us again.

Meantime, their carriers were to stand off out of range of our fleet.

The double trouble for the Japs was that our fighters shot down their planes practically as fast as they appeared, and what few did get through couldn't use Guam because we had dive-bombed the airfield until its surface looked like a Swiss cheese.

Somewhere, there west of us, was a Jap fleet. We waited. Finally the orders came.

We didn't know it then, but we were going to participate in the First Battle of the Eastern Philippines. It would be a long strike, 300 miles or so. The Helldivers had much

more range than earlier dive bombers. They had more than 1,700 horsepower on their noses, whirling three-bladed steel propellers.

But, even so, we ran the chance of losing all the planes we launched. The point, of course, was that the richness of the target was worth the risk.

Bombing One pilots and gunners climbed into their planes. Despite the size and weight of the Helldivers, take-offs were simplified by aerodynamic refinements. Outboard on the leading edges of the wing were "slots," which go into operation when the leading gear is lowered, assuring lateral control at low speeds. When the needle on the air-speed indicator was at a dangerously low point, a part of the leading edge of the wing would pop out to channel an auxiliary flow of clean air over the ailerons.

One by one we rolled down the length of the deck, rendezvoused, and settled into formation. Off to the right the planes of other flat-tops were heading west.

It was a long flight. Presently two of my planes got croupy engines and turned back. That left 13.

Except for the blobs of cumulus clouds, it was a perfect late afternoon. Here and there the clouds obscured the sea.

Even before we flushed the Japs we knew they had been found. The first elements of our striking force relayed the news in code. They were killing time, awaiting our arrival.

Then, of a sudden, our target was ahead of us in plain sight. It was huge. It stretched to the horizon, all around. There were flat-tops, battleships, cruisers, destroyers, and the inevitable "train" of supply ships. It all looked peaceful enough as the afternoon sun slanted on the water. Two of the vessels, toy ships on a pond, were refueling. Astern, flanked by two or three cruisers and some destroyers, was a big *Shokaku*-class flat-top of 30,000 tons. Its deck was bare.

For a dive-bombing pilot, this was smorgasbord.

"We're going after the big one astern," I radioed the leader of our torpedo-bomber squadron. I glanced around. All of my boys seemed O. K.

We nosed over at 15,000 and were doing 260 knots in our high-speed approach. We opened the bomb-bay doors and pushed over—steepening the dive—at 9,000 and opened the diving flaps. The flaps, or air brakes, are inboard on the trailing edge of the wing. In position for a dive, they angle upward and downward to form an elongated V.

The big bomb is carried internally, for the

first time in the Helldiver design, to streamline the plane and provide more speed. The ship is fast enough to keep up with its escorting fighters, the Hellcat and the Corsair.

Antiaircraft guns began winking at us. The flak floated past, reddish-brown, white, and silver. AA fire comes straight at you, and you wonder why it doesn't hit you.

The carrier began turning. It turned amazingly fast. That worried me. My plane as yet was not in bombing attitude. I wouldn't go into a 70-degree dive until I was down to some 6,000 feet. I was leading the carrier with my sight in an effort to lay the bomb in the middle of its deck. I kept riding the rudder pedals.

Dive bombing is a matter of estimation—estimation of the wind, the speed and course of the target, and the amount of time it will take your bomb to drop from a given altitude. You watch your altimeter, compensating in your head for the "lag" it shows behind your actual altitude.

There is little sensation to a dive. You know you are picking up speed. The pressure on your eardrums tells you so. Your senses are alive to everything, even the littlest item. The target keeps getting bigger. The whitecaps, which from upstairs looked like white fluff on glass, begin taking on motion.

The flat-top was trying to complete a circle. I steepened my dive. In a moment the altimeter said "go." I pressed the button, automatically reaching for the manual release to make sure the bomb was gone. With the next motion I closed the diving flaps and bomb-bay doors and pulled out.

Pull-outs are a lot worse in fiction than they are in fact. Your legs feel heavy for a moment. Your sight sometimes dims, as though someone had clipped you on the chin with a boxing glove. Then it's all over.

I raced away, riding the rudder, hauling and pushing on the stick to make my plane a poor target. Things happen in slow motion in battle. I flew for what I thought was a long time. Then I turned to count my planes. Instantly tracers began outlining the Helldiver in red. I resumed course, taking violent evasive action. Pretty soon there were no more tracers.

I called up my squadron on the radio. Fuel was low. It would take time to rendezvous, so planes would have to return in independent groups. Five of my planes joined up with me. I wished we could wait for the rest. We headed east.

It hadn't been a bad strike. Three members of Bombing One had hit clean. My bomb had been a near hit. The flat-top was burning so well that the last two pilots to push over decided not to waste their bombs on it. They attacked a cruiser.

Fire is the bane of the flat-top. If you can penetrate the deck plates, the chances are you will ignite the oil and high-octane gasoline stored below. Normally that stops it dead in the water. A flat-top's watertight compartments make it hard for dive bombers to sink it, but the torpedo planes do a nice job of finishing it off.

It looked as though the torpedo planes had registered three hits on our target. Other ships in the Jap fleet had taken a pounding, among them a *Kongo*-class battleship. A *Hayatsuka*-class carrier was sunk. Another in the same class was damaged. A cruiser and three destroyers were hit. Three tankers were sunk, two others left burning.

Our planes flew eastward, throttled back to conserve gas. The sun went down. Dusk came, then night. The fuel needles crept across the faces of the dials. It looked bad. I kept rehearsing the sequence of what to do in a water landing.

My fuel needle wavered uncertainly at the far corner of the dial. Now it was almost on the little peg at the corner. This was it. I waited for the engine to gasp and conk out. And right then, as though in answer to a prayer, we looked down on the home hearth.

A lot of planes went into the water that night. Some "splashed," as Navy parlance has it, short of the fleet on their way home. Some milled around above the fleet, trying in the melee to find their home decks, and failing. Some landed on other carriers.

The destroyers were everywhere, wet from stern to fantail as always, pulling dripping pilots and gunners aboard.

I happened to make our carrier—with five minutes' fuel left in my tanks. A cursory roll call brought little response. I kept saying to myself, "Well, it was a damn good squadron while it lasted." I could think only in the past tense. My pilots, my gunners, my planes, were gone.

And then, one by one, destroyers began drawing alongside and the men of Bombing One began clambering aboard our flat-top. Pretty soon I had half my flight, then three fourths of it, and at the end of three days every man Jack had returned. Our casualties: one cut finger.

If all the awards I recommended come through, the men of Bombing One are going to have a lot of decorations on their blouses. They deserve them.

Old subscribers who have sets of early numbers of *POPULAR SCIENCE MONTHLY* are urged to dispose of them to public libraries, many of which now have a new periodical index covering this magazine for the years 1890-1899.

Wheels That Can't Slip

(Continued from page 125)

one of these various kinds of cutting machines. So the blanks are held tightly in the desired position. This is done with locating pins which are held in a mechanism controlled by compressed air. By turning the air pressure on or off, the operator can release or tighten the blank in the machine with a flick of the wrist.

All of the cutting entailed in the manufacturing of metallic gears is done in jets of the proper cutting fluids. Since the gears, when used in flight instruments, may be subjected to both desert heat and arctic cold, the most faithful of metals are used. And since even a pinpoint of rust might affect the accuracy of the instrument containing the gears, extreme care is taken to prevent corrosion.

Inspectors sit alongside the operators of the automatic cutting machinery and test every piece of metal repeatedly. The diameter, drill hole and shape of each blank are checked. And every finished gear is tested as to size, concentricity, smoothness when rolling with a master gear, and for burrs or sharp edges on the teeth.

When assembled in units, the gears are further tested for smoothness and backlash. Much of this checking is done with a stroboscope, an instrument that indicates

minute fluctuations from uniform or constant speed while the object under inspection is in motion. And, of course, there is a final test when all the gears are assembled in the proper places in the main instrument housing, for every one of them must do its stuff with far greater precision than a dancer in the famous Radio City Music Hall chorus line.

"As man continues to achieve higher and higher speed, power, and efficiency for his mechanical contrivances," says K. E. Bauerle, gear engineer of the Sperry Gyroscope Co., "he also becomes increasingly aware of the necessity for improving the precision, performance and durability of his most precious machine element—the gear."

"The gear has come to be properly regarded by him as the reliable co-ordinator of the numerous types of motions which he is forever scheming into his mechanical devices. It has become the nucleus about which he arrays the levers, wheels, shafts, and pistons that do the world's work for him."

The war has accelerated the mass production of fine-pitch gears to direct engines of death. Such gears also can co-ordinate and guide peacetime work with speed and accuracy.

How Good a Weather Prophet Are You?

Here are the answers to the weather quiz on page 130. Check your results and see how well you made out.

1. **FALSE.** Humidity, clouds, and other phenomena collectively known as weather, extend to only about 30,000 feet.
2. **TRUE.** A warm air-mass invasion pushes its head into the substratosphere and causes "mackerel skies," etc.
3. **TRUE.** The altimeter is really an aneroid barometer.
4. **TRUE.** Ice forms rapidly in the turbulent changes of cumulus clouds.
5. **FALSE.** A cloud ceiling is the base of a cloud formation.
6. **TRUE.** A warm front extends over large areas (about 1,000 square miles) and moves more slowly than a cold front.
7. **FALSE.** Close-together isobars indicate steep changes and high winds.
8. **FALSE.** Winds increase with altitude, being free of surface friction.
9. **TRUE.** Rain seldom falls from the higher clouds.
10. **TRUE.** The weight of air presses with a force of about 15 pounds per square inch at sea level.
11. **FALSE.** A high-pressure area is a good-weather area.
12. **FALSE.** All-metal ships give protection against lightning.
13. **FALSE.** The cumulo-nimbus throat has terrific updrafts.
14. **TRUE.** Hailstones are frozen rain pushed up in thunderhead drafts.
15. **FALSE.** Mare's-tails are cirrus wisps.

"Green Gold" of Wyoming

(Continued from page 114)

handsome prices. After awhile it dawned upon him that this was better than the hardware business. He sold out and now gives all his time to hunting the precious stones, selling some in the rough and cutting all he can. One firm is taking his entire output of finished pieces, and he says he could dispose of much more if he had the equipment and help.

Rhoada is half owner of the 3,366-pound stone, for it was Mrs. Rhoada, with a friend, Mrs. Ray Morgan, who found it. The huge boulder is lying in the Rhoada back yard. They are in no hurry to sell it, for their valuation of it keeps going up as they learn more about the real worth of jade.

A wandering mineralogist, searching for agates, seems to have been the first to recognize jade in the Wyoming area. Picking up a rich, green pebble, he looked at it sharply, looked again, and exclaimed to his native guide, "I'd rather have a mine of this than a gold mine. This is jade."

Oddly enough, this significant remark caused no stir in the community. The mineralogist went on his way. Now, nobody even remembers his name. That was eight or nine years ago. And then one day Allan Branham took a notion to send some of the green rocks east and see if he could get anything for them. People laughed at his idea of wrapping up stones and shipping them. But soon the checks started coming in, and with them came urgent requests from jewelry manufacturers for more of the rocks.

Word spread around Lander and the rush started, but it was still slow to get under full steam; most of the people simply wouldn't get excited about the green stones they had been seeing all their lives, lying about on the hills and in the valleys.

All the jade rocks and boulders found in Wyoming have proved to be jade all the way through. It has the usual variation in quality, some being suitable for the finest jewelry and some for cabinet work, but all of it is valuable.

Geologists assume that the jade was thrown up by some immense natural upheaval centuries ago. The jade rocks are not rounded and smoothed as they would be if they had been brought into the territory by glaciers. Some have been partly smoothed by erosion, but others are sharp and jagged.

There are two kinds of jade, nephrite and jadeite, about equally valuable. All of the Wyoming mineral is nephrite, as is the majority of that carved so beautifully by

the Chinese. The color of jade is extremely variable, ranging all the way from black through to brown, olive green, apple green, and even white, with countless combinations of these. Each piece has its own individuality and the expert cutter designs his finished article of jewelry in accordance with the possibilities of the material. It is a special art developed by the Chinese, who have excelled at it for centuries. So-called Chinese imperial jade, which sells for as much as \$500 an ounce, is cut from a rare kind of streak occurring in some pieces of nephrite. Wyoming has produced some of this top quality.

Prices obtained by the Wyoming jade hunters are going up progressively as they gradually realize the true value of their native stones. Some jade was sold as cheaply as \$1 a pound, but hardly anybody is so foolish now. Current selling prices for the rough material are somewhere in the neighborhood of \$15 a pound, as compared with \$50 and \$60 paid by the Chinese for no better jade from Turkestan and Burma. Sheep herders, cattlemen, and ranchers are learning that it is worth while to pick up the pebbles and stones they discover on the range. They bring them into the towns of Lander and Riverton and sell them to local citizens who are in the jade business.

Even in the areas already thoroughly searched, occasional rich finds are still made. Those who have become professional jade hunters now go about chipping pieces off rocks that do not immediately reveal they are jade because they are covered with lichens or have not been exposed long enough to have been polished by wind-blown sand. The only handicap is that there is a lot of rock in Wyoming.

Erosion constantly uncovers more of the precious mineral. How much of it there is can only be imagined, but there is every reason to suppose that it is a prodigious amount, possibly the richest jade find in all history.—GOLD V. SANDERS.

WHERE HAVE WE MET BEFORE?

IT was at Tarawa — on the beach at Anzio — in Normandy — in bombers over Berlin — in tank battles, dog fights, and on the high seas — on every fighting front.

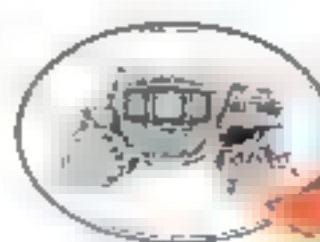

These are the recent places where the craftsmanship symbolized by this emblem has been meeting up with the men who are winning the war. And every day sees a new meeting on other fronts as the output of Fisher Body factories moves into the battle lines.

Major assemblies for the B-29 and other bombers, delicate aircraft instruments, big guns of various calibers, tanks — the flood of Fisher Body armament knows no end until final victory.

The Army-Navy "E" flies above our Fisher Body plants for excellence in aircraft production and from two others for tank production, while the Navy "A" with four stars, is flown by just another Fisher Body plant for its naval ordnance work.

Into every single piece go the skills and techniques that have always made the Fisher Body coach a symbol of fine craftsmanship throughout the length and breadth of our land.

OF QUALITY

Choose the Name You Can Trust in Rubber!

Today, *all* tires are manufactured from GRS (Government Rubber, Styrene).

All manufacturers of tires start with this same new, wartime plastic.

Extra safety and mileage in today's tires, therefore, can come *only from extra skill in tire building—from superior compounding and craftsmanship.*

That's why the name that is "signed" to the new tires you buy is far more important now than it ever has been before.

Twenty-four years devoted to building the BEST in tires have given Seiberling a rich background of achievement in rubber research and a priceless reputation for honesty in the making and marketing of fine quality tires.

You can select today's Seiberling Tire with complete confidence—with the knowledge that it is the finest synthetic tire you can buy... for it bears *The Name You Can Trust in Rubber.*

SEIBERLING

Experts in Rubber

*We invite you to inspect this
SUPERIOR SYNTHETIC TIRE*

In your vicinity there is an Independent Seiberling Dealer who will be glad to show you this latest Seiberling achievement. You'll find it a good looking tire—one that will give you the maximum in safety and mileage—and worth waiting for, if you must.

The Bazooka's Grandfather

(Continued from page 69)

and disintegrate. In TNT, this wave may travel five or six miles a second, and in some other explosive substances it goes even faster. It can jump across short air gaps, yet sometimes can be stopped with surprising ease by interposition of a comparatively thin layer of some sturdy material. The turmoil of the explosive's molecules, as the wave progresses, creates force, which moves outward at right angles to the surfaces of the charge.

In the hollowed-out portion of a shaped charge, this force coming from the sides of the cavity is concentrated into a jet. This jet has greater energy, pressure, and heat than the force that emerges from the flat, outer sides of the charge. The explosive waves are merged and focused as though they were streams of water, or rays of light, or waves of sound—and their effectiveness is greatly enhanced.

By changing the shape of the conical cavity, the width of the jet can be varied. A shallow cone, for example, causes a fairly wide jet and a deep one causes a narrow and more intense jet. Hence, one type of cone is used to punch a wide but shallow hole in an object, and another type to create a deep, tubular hole.

Suppose now, that, in addition to the waves of hot gases and explosive force spurting from a charge, pellets or fragments of metal were included in the jet. The destructiveness of the jet obviously would be made even greater. And this is exactly what has been accomplished by placing suitable linings, made of thin metal or some other material, in the conical cavities of shaped charges.

Linings have been developed which are literally turned inside out by the concentrated explosive force. When thus turned about they become teardrop-shaped pellets which are driven into the target. Other linings are torn into tiny fragments quickly by the explosive force and those fragments are hurled at the target. As visualized by ordnance experts, the tiny fragments lead the way, followed by larger ones, and thus a hole is punched in the target that grows wider as the jet continues on its swift, destructive way.

With a shaped charge of TNT weighing only 10 pounds, a hole $1\frac{1}{4}$ inches wide can be blown through eight inches of steel armor plate, or a hole twice that wide can be punched through a 30-inch reinforced-concrete slab. And, by firing a second shaped charge of TNT at the same spot, that hole can be widened and deepened.

Such invasions of armor and concrete are possible with the smallest of three standard-shaped charges supplied to the engineers for demolition blasting. By using a slightly bulkier, but no heavier, shaped charge of a new explosive mixture that is more powerful than TNT, the wreckers can blow a wider and deeper hole in either steel or concrete with a single explosion.

And, for really tough demolition jobs, the engineers use a heavier shaped charge. One blow from this one will punch a hole through five feet of reinforced concrete. If that concrete is part of a pillbox, the interior will be filled with bits of metal, hot gases, torn-off chunks of concrete, and other flying debris that will make life unendurable for the occupants. And if this violence is not sufficient, a long, narrow Bangalore torpedo or a flame thrower can be shoved through the hole left by the shaped charge and used to complete the destruction of the occupants of a pillbox.

If Japs are hidden beneath log or steel-drum bunkers, one of these big shaped charges can be set on top of their cubby-hole and detonated. The charge will completely penetrate four feet of earth and four layers of 12-inch logs, sending hot metal fragments into the emplacement and filling it for five minutes with highly disagreeable smoke, debris, and dust.

If a more massive concrete obstacle must be removed, an engineer can set one of his big shaped charges against it and produce a hole about 60 inches deep, five inches wide at its mouth, and three inches wide at its bottom. A hole that size is plenty big enough for the insertion of more explosives to do whatever additional damage is desired. Yet the shaped charge makes such an opening as readily as you can drive a needle into loose sand.

These shaped charges, moreover, need not be clamped tightly against the surface that is to be punctured. The Germans have put magnets on the sides of some of their hollow charges to hold the charges against metallic plates. But if a horizontal surface is to be punched, the weight of the shaped charge is sufficient to hold it in place. If a hole is desired in a vertical wall, the shaped charge can be propped against the wall with a light pole, or hung from a wire like a picture frame.

But shaped charges need not always be carried to their target by hand. They can also be conveyed in rockets. In fact, one of the most important applications of the Munroe effect is in giving relatively slow-

America's oldest industry—the fishing industry—has benefited in peace and in war from AC's easy plan for maintaining spark plug efficiency. Regular cleaning and adjustment, by AC methods, have helped thousands of the fishing industry's motor trucks to speed their perishable cargoes to market or cannery. Worn plugs, of course, are promptly replaced with AC's for utmost reliability. Thus, another of America's essential industries shows you how to conserve your transportation,—have your spark plugs cleaned and adjusted every 3,000 miles, and install AC's—of the right Heat Range for today's driving—when the old plugs have served their term.

SPEED FINAL VICTORY — BUY WAR BONDS

moving rocket projectiles the penetrating power of high-speed shells.

The army ordnance bazooka projectile, for example, is a rocket containing a shaped charge. The striking end of the projectile is hollow, and behind this open space is the wide end of a cone. Back of this cone is the explosive. It is detonated by a fuse in the rear, and the explosive force is shot forward after the rocket has hit. This concentration of the force enables a man armed with a bazooka to shoot a hole in the side of a heavy tank. The design of the high-explosive end of big rockets is similar.

In a rifle grenade, too, the Munroe principle is applied. The forward end of the grenade is left hollow, and the explosive's force is focused on the target by a cone.

The use of this principle in ammunition, however, is not limited to rockets and grenades. It also is used advantageously in artillery ammunition. But this poses a problem that is almost the reverse of that encountered in designing other armor-piercing shells.

A standard type of armor-piercing projectile has a heavy steel nose and is shot from the gun with such tremendous velocity that this nose is driven through the armor before the explosive charge in the base goes off. But ammunition in which the Munroe effect is utilized has a hollow nose, which crumples when it hits the armor. The cone behind this nose then focuses the explosive force against the armor.

So, in designing the latter type of shell, the problem is to build a nose that will crumple just the right amount when it hits the armor, rather than one that will go through the armor. Unless the nose crumples exactly the right amount, the hollow charge will be detonated too near or too far from the surface of the armor, and the result may not be satisfactory.

The distance between a hollow-charge explosive and its target at the time of detonation is known as the stand-off distance. Experience has shown that it is highly important. When this distance is exactly right, the jet from a hollow charge hits with such tremendous force that it actually makes steel flow like thick mud.

Much depends, too, on the type and thickness of the cone's lining. If that lining is a few hundredths of an inch thicker in one place than in another, and hence a bit more resistant to the explosive force on one side of the cone than on the other side, the jet will wobble and lose part of its force.

Similarly, a crack or very slight unevenness in the shape of the cone or its lining may greatly reduce the Munroe effect. Even the speed with which the detonation wave

Tough

BUT OH SO GENTLE

- Worn-out piston rings cause needless wear *inside* your engine, where you can't see the damage. And if they're not promptly replaced, the wear grows worse and worse—until, finally, your engine may quit you for keeps.

But, fortunately, piston rings warn you when wear becomes critical. Your engine smokes, wastes oil and loses its power.

At the first sign of ring wear, it will pay you to have your motor specialist install a set of Hastings Steel-Vent piston rings. They stop oil-pumping, check cylinder wear and restore engine performance.

The Bazooka's Grandfather

(Continued from page 212)

starts through the charge is an important factor.

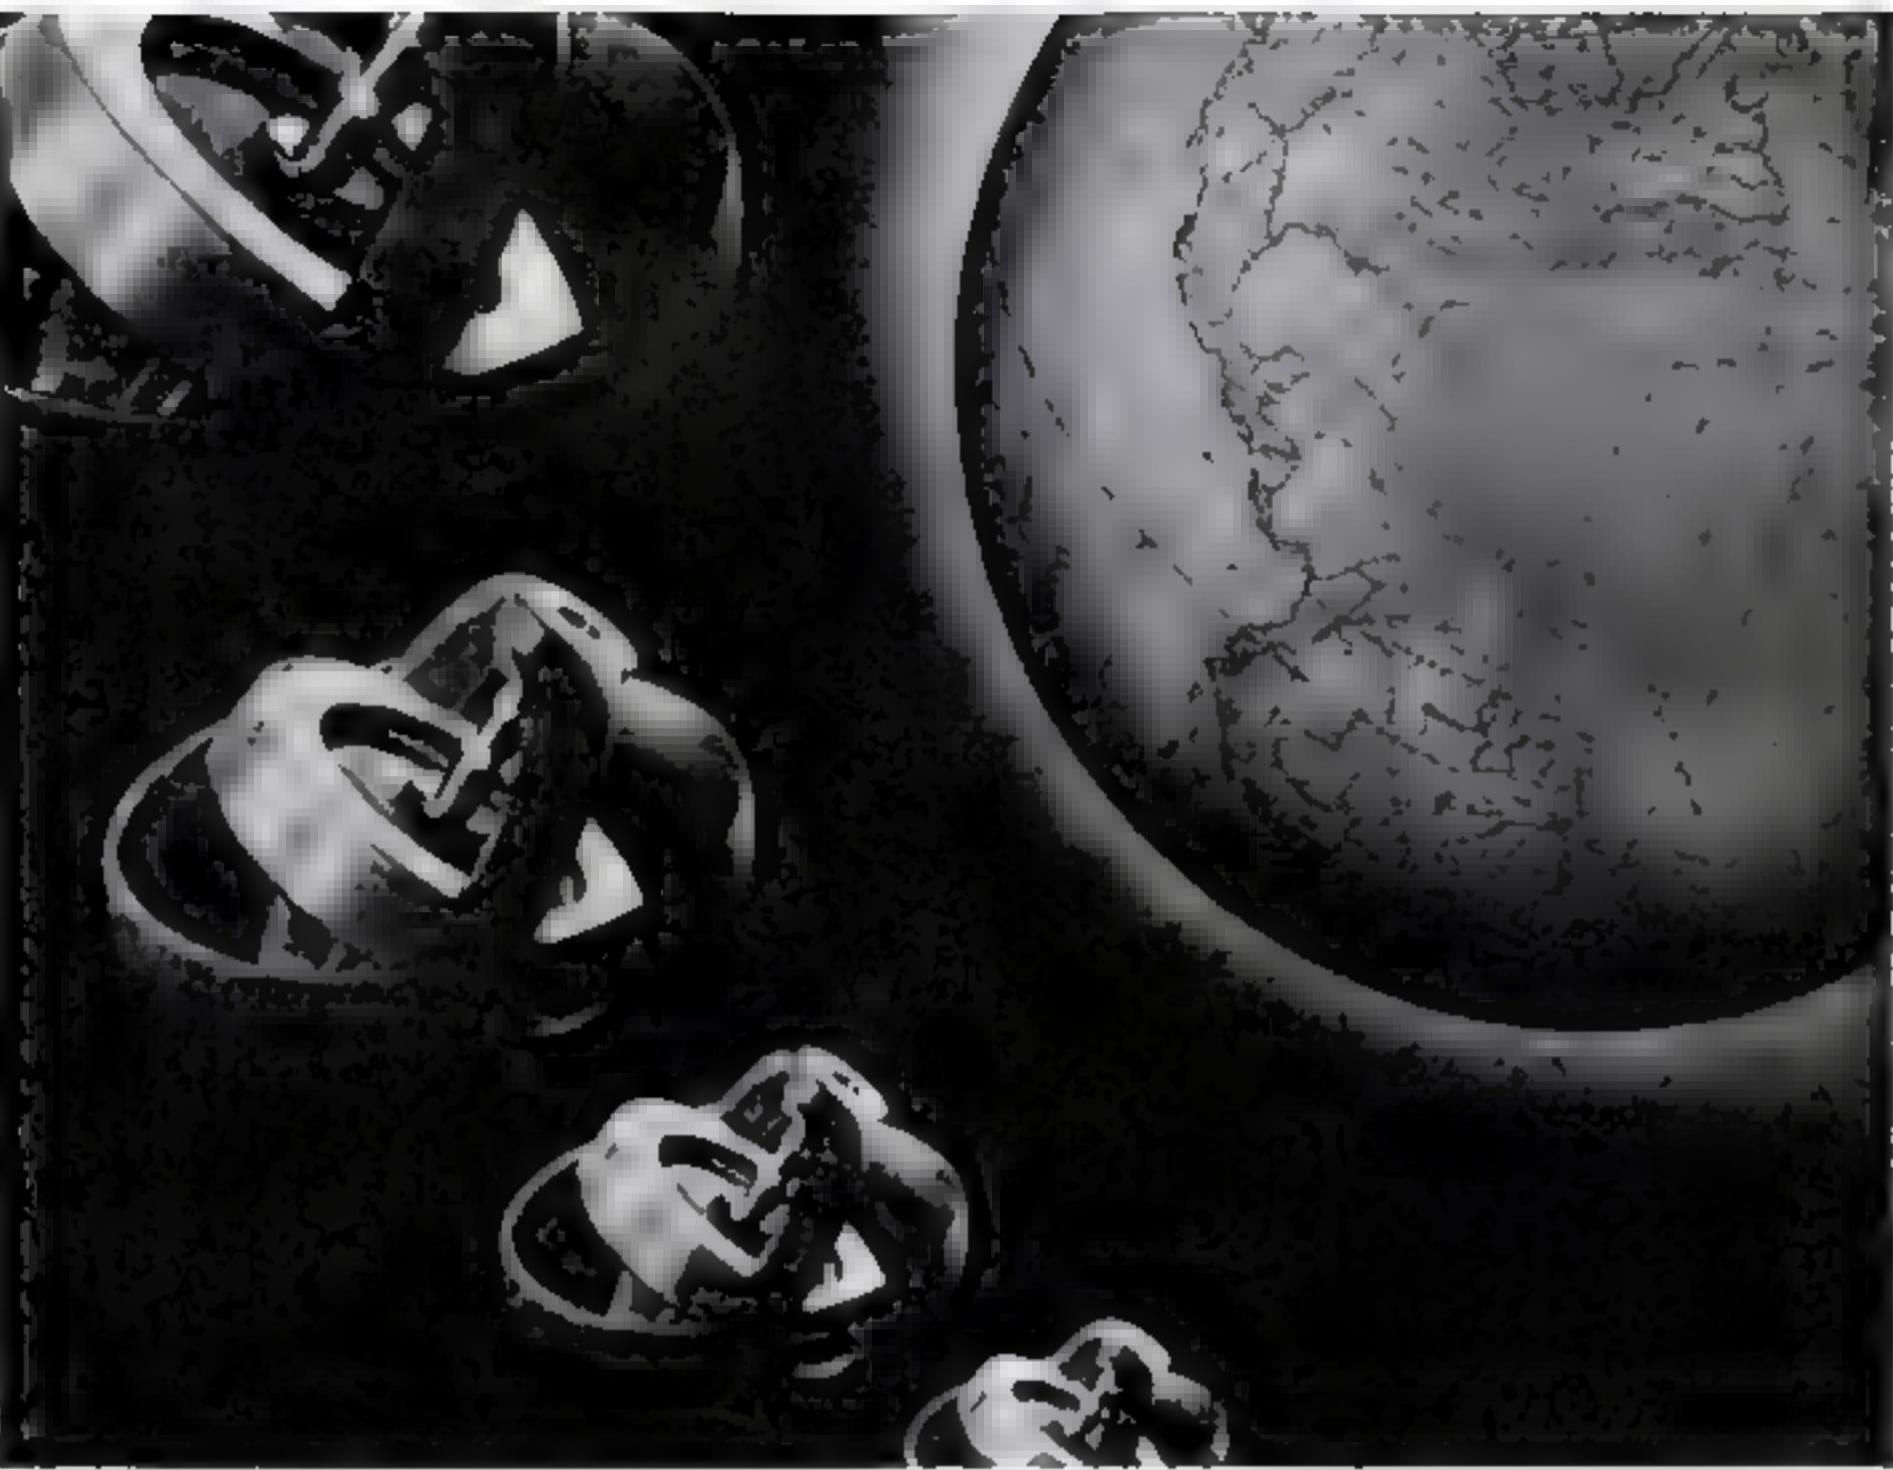

World War II has been partly a race between United Nations and Axis experts to learn more about the best ways to determine and regulate stand-off distances and to find the most efficient linings for the cavities of hollow charges. It has been a quest for precision. This race has been run by ordnance researchers, however, without benefit of cheers from the public, lest premature revelation of some bits of information help the foe to catch up. Tests that have been made with German and Japanese hollow-charge explosives indicate that the Allied ordnance experts are well ahead of their rivals.

The engineers' uses for shaped charges are manifold. Assume, for a moment, that a bridge must be cut. It can be done either by severing one or more spans or by knocking out supporting pillars. In either case, hollow charges can be helpful. They can be used to weaken a span by punching holes in it. But spans usually can be replaced more quickly than supporting pillars. So the engineers may choose to demolish the pillars. They can do this by punching holes in them with hollow charges, filling those holes with additional explosives, and thus leaving the whole bridge shattered as irreparably as Humpty Dumpty.

You may wonder, when you observe the shape of a hollowed demolition charge placed against a sturdy obstacle, why it does not simply fly off like a rocket when detonated. The experts' answer is that the explosive force is spent too swiftly, and is countered too effectively by the emergence of other force from other sides of the charge. The distance that a demolition engineer must stand back for safety's sake, when detonating his shaped charge, depends partly on the composition of his container—and this is another matter which has been the subject of research.

The extent to which the wild forces of an explosive wave can be focused, however, is truly astounding. If, for instance, a hollow charge with a deep cone such as is used for demolition work is turned toward the sky and shot off at night, the result is a pillar of brilliant, flaming gases, almost as slender as a bolt of lightning, but as straight as the beam from a searchlight.

More than a million such wheels are now in use . . .

What is it?

This wheel is a gyroscope.

The world is a gyroscope, too.

Spinning freely in space, the world maintains its axis in a fixed direction in its orbit.

A rotating wheel, universally supported, will also maintain its axis in a fixed direction in space.*

This unique characteristic of the gyroscope makes possible some of man's most remarkable and useful instruments.

For example:

. . . blind-flying instruments which show pilots the way through the hazards of fog and stormy weather (SPERRY DIRECTIONAL GYRO, SPERRY ARTIFICIAL HORIZON).

*By Isaac Newton's first law of motion.

. . . a device which can relieve the human pilot and hold an airplane level and on its course for hours with no hand on the controls (SPERRY AIRCRAFT GYROPILOT).

. . . a non-magnetic compass which always points to true geographic north and guides our convoys through all kinds of weather (SPERRY GYRO-COMPASS).

These are but four of nearly 50 essential Sperry instruments of war and peace in which the gyroscope plays the principal role.

Sperry is an organization specializing in the solution of precision engineering problems, many of which have been solved by application of the gyroscopic principle. Many of its products designed originally for peacetime

use are now seeing service on every fighting front.

When the war is won, Sperry products—hydraulic and electronic as well as gyroscopic—will again return to the work of peace.

Power in Cyclones on Deck

than in Carrier's Turbines Below!

Surging into the wind at 30 knots, this 20,000-ton carrier is driven by massive turbines which can turn up more than 100,000 horsepower. On deck, there's a 1,700 HP Wright Cyclone in each Curtiss Helldiver and Grumman Avenger. Mighty as the carrier is, a normal number of these single-engined planes aboard may total 50,000 more horsepower in combined form than the turbines below.

Weight, size and power are the three critical points of an aircraft engine. It must be light to permit flight, compact to cut drag, powerful to carry heavy planes at high speed. Wright Cyclones come from 25 years of work on such problems. That's why it takes such a few Cyclones to equal the power of a carrier.

LIGHTEST: The Cyclone 9 of 1,350 HP in new FM-2 Wildcat is first service engine under a pound per HP. It weighs only 0.97 lbs. per HP.

TOUGH: A Cyclone 9 in a Douglas SBD-3, with oil line and 4 of 9 cylinders shot out of action, kept right on running to bring pilot and plane safely home.

Railroads Hit the Beach

(Continued from page 83)

The MRS is patterned strictly on orthodox railroad organizations. The basic unit is the Railway Operating Battalion, made up of four companies. Each has its duties: dispatching and supplies, track and signal maintenance and maintenance of way, roundhouse operation and equipment repair, and the actual operation of the trains. A battalion runs a division of about 100 miles.

Three or four Railway Operating Battalions, together with a Railway Shop Battalion, a Base Depot Company and a Mobile Railway Workshop, make up a typical grand division. That corresponds in scope and authority to a general superintendent's domain on an American railroad.

Maj. Gen. Charles P. Gross, chief of transportation, is responsible for the MRS. Brig. Gen. Andrew F. McIntyre, formerly of the Pennsylvania, handles details at home.

A lack of standardization complicates the job. Clearances are the bane of the car and locomotive designer's pencil. Even in peacetime clearances lead to some fantastic routings. Any oversize shipment—one with considerable "overhang," projecting beyond a car's head-on silhouette—bound from New York to Washington, for instance, has to travel by way of Harper's Ferry, Va. There are some tunnels on the direct route that it won't clear.

In manufacturing for the Russians, American car and locomotive makers had few prohibitions. The average width of rolling stock in the United States is 10 feet, 8 inches; its height from the top of the rail, 15 feet. Russian stock runs to widths of more than 12 feet and heights of more than 17. In England, the width averages only 9 feet and the height less than 13.

Cars and locomotives for England had to be equipped with the exact opposite of the

Railroads Hit the Beach

(Continued from page 220)

American braking system. Over here compressed air is used to keep the brake shoe off the wheel; when the air is released the brake clamps on. In England a vacuum in the air line sucks the shoe onto the wheel.

American manufacturers discovered they had to take the Russian temperament into account in filling lend-lease orders. Spare wheels had to be shipped by the thousands. When a Russian locomotive engineer comes to a grade and claps on the brakes, he takes no half measures.

They discovered they had to equip locomotives intended for India with extra-brilliant headlights. That was so the engineers could see the sacred cows, wild elephants, and human foot traffic on the right of way.

There was the field problem of increasing the traffic on Indian railroads to deliver supplies to the Ledo Road truck route and to the airfields used by planes flying "the Hump." The Bengal and Assam Railway had twin gauges, extra wide and narrow. It wound north from Calcutta for 800 miles, and then all the supplies had to be transshipped on to meter gauge for almost 1,000 miles more.

For 31 of the last 32 years the narrow gauge had been inoperative for as much as six months of the year when rivers boiled out of their banks. U. S. railroad men rechanneled the rivers and built a bridge as a substitute for the car ferries traditionally used for the crossing of the mile-wide Brahmaputra River. Where three or four trains a day ran before the war, from 21 to 25 are now operating with 12,000 wagons and 550 locomotives of the 2-8-2 type, marked "Made in U. S. A."

The MRS has had its compensations. When it landed behind the assault troops in North Africa, what should meet its delighted eye but a score of "General Pershing" locomotives that the United States shipped to France for World War I. They were as good as ever.

German railroads, with 44,000 miles of standard gauge, present no great problem to the Army. Nor will the railroads of China and Japan. In row upon row of secret files in Washington's sprawling Pentagon Building are details on Japanese and Chinese railroads.

The Military Railway Service of the Army's Transportation Corps has only one problem it hasn't solved. It would like to know how to keep monkeys from swarming into passenger carriages when trains stop at stations in India.

NEW ATLAS PATTERN SERVICE FOR WOOD CRAFTSMEN — See ad on page 236

Another great day in railroading was heralded in January, 1948, when the Atlantic Coast Line ran the first de luxe varibloc Pullman train from New York to Jacksonville, Florida.

IT'S A GREAT NEW DAY FOR RAILROADING

Today powerful GM Diesel locomotives on the Atlantic Coast Line whisk Florida's fresh fruit and vegetables to major American markets in a matter of hours. This is possible because these locomotives haul heavy trains faster and stay on their job longer with few stops for service.

ONE thing is certain—Americans will have an entirely new level of transportation, post-war. Two factors will make this inevitable:

The amazing achievements of the railroads under the stress of war.

The new and exciting prewar records for rapidity, regularity of service, safety and comfort the railroads had established with General Motors locomotives.

American railroads are in a favored position to lead in this fine new service because a most vital tool which makes it possible is fully developed and thoroughly proved. Already General Motors Diesel passenger and freight locomotives are operating on more than 100 million miles, annually, of regularly scheduled service. Yes, it's a great new day for railroading—with even greater days ahead.

A NAME TO REMEMBER, WHEREVER YOU ARE—
AND WHEN YOU COME HOME

Japan's "Mystery Ships"

(Continued from page 96)

They never got there, because they had given us enough time to reorganize a fighting fleet powerful enough to hurl them back with smashing losses in the Battle of Midway. Later, when our own amphibious forces seized the offensive in the Solomon Islands, Nipponese warships staged a whole series of attacks in gradually increasing strength. Why they failed to use their full power at first can be explained only by the inscrutable Oriental mind; as it was, we were able to reinforce our embattled fleet rapidly enough to repel every onslaught.

From that time until last October the constant question was, "What will make the Jap fleet come out and fight?" The answer came when MacArthur invaded the Philippines, with the obvious objective of taking Manila and its strategic naval base astride Japan's life lines to her southern conquests. And the result was the Second Battle of the Philippines—actually three battles in one—where mighty battleships slugged it out with shells in the rare and awesome spectacle of a full-dress fleet action.

It was a desperate gamble, since it committed virtually all of Japan's warships, but a better move than to wait until growing Allied seapower sealed the gates of the Empire. From southern Asia outposts, a pair of Jap fleets sought to thread the two main passages through the Philippines and meet in a pincers movement, where MacArthur's supposedly vulnerable invasion craft were unloading reinforcements and supplies on the island of Leyte. Meanwhile, a third Jap fleet approaching from the north would provide support. If complete surprise could be obtained, so much the better.

Wary of just such a move, however, Vice Admiral Thomas C. Kinkaid had posted U. S. submarines as lookouts on the western side of the Philippines, meanwhile guarding MacArthur with his 7th U. S. Fleet of battleships and lighter craft—supplemented by Australian cruisers and destroyers. Promptly the subs detected the invaders and flashed him warnings. Shortly after, a scouting plane sighted the Jap fleet from the north, and relayed a message to Admiral William F. Halsey's U. S. Third Fleet of fast battleships and carriers, roving farther to sea.

Cramming on speed, Halsey sped north and intercepted the surprised Japs at dawn. Before they knew what had hit them, their four carriers were sunk—and the rest of the ships, many damaged, turned tail. Reluctantly abandoning pursuit, Halsey dashed

QUALITY . . . WORTH WAITING FOR

**THERE WILL BE A
SLIGHT PAUSE . . .**

One of these days, restrictions will be lifted on outboard motor sales for pleasure use.

While Johnson has the facilities to build a major share of all outboard motors manufactured, there will definitely be some lag between the lifting of restrictions and full deliveries of all Sea-Horse models.

How long? That depends on many things, including army and navy requirements. There has been, there still is and there will be a large army and navy demand for Sea-Horses.

The qualities that make Sea-Horses suitable for war—ruggedness, smooth performance, and DEPENDability—are qualities worth waiting for. To get these qualities, you may have to wait a while after restrictions are lifted; but you'll have them for YEARS of satisfaction thereafter.

DEALERSHIPS: If you are interested in selling AND SERVICING outboard motors after the war, write us now—no matter what your location may be.

...Have you tried
Its New "Look of Youth" on You?

ANOTHER great Zenith advancement is encouraging new thousands to discover the blessings of a hearing aid!

The Zenith Radionic Hearing Aid brought the cost of better hearing within reach of all. Now the new Neutral-Color Earphone and Cord brings a new standard of smart appearance that enables you to wear a hearing aid with poise and confidence.

This Zenith ensemble is actually *as little noticeable as eyeglasses!* Its streamlined, complexion-tinted plastic earphone is light in weight, comfortable. Its translucent plastic cord is perspiration-proof, fray-proof, kink-proof . . . gives less friction or clothing noise than any fabric-covered cord.

Ask the Zenith dispenser near you for a free demonstration of the smart looking, superbly performing Zenith. No obligation! Send coupon below.

Why Its Fine Quality Costs You So Little

If only a few Zeniths were made, each would cost many times more, yet have less precision quality—as Zenith proved when its precision mass production lowered the cost of a \$200 radio to \$29 and made it an even finer instrument. Now Zenith combines this production with a sales method which eliminates salesmen's huge commissions and other high sales costs . . . to bring you an even finer hearing aid than our original \$50,000 model.

CANADIANS! The Zenith Radionic Hearing Aid (Air Conduction) with Neutral-Color Earphone and Cord is available in Canada—direct by mail only—at \$40 (Canadian currency). No extra charge for shipping, duties, taxes! Write Dept. PS-15, Zenith Radio Corporation of Canada, Ltd., P. O. Box 30, Windsor, Ontario.

FREE! Illustrated Descriptive Literature
Gives complete information on advantages of the three new Zenith Radionic Hearing Aids. Mail coupon now!

WINTER DRIVING

demands clean engines

FREEZING weather brings many hazards to motors and their lubricating systems. Oil congeals and flows slowly—causes hard starting, battery drain and inadequate lubrication of vital parts...hence costly layups and repairs. Water—due to condensation—forms in gas tanks, creeps into fuel lines, carburetor and fuel pump...causes stalled motors and other troubles.

Wise motorists foretell such hazards and—simultaneously—fight sludge, gum, acid and corrosion—your round enemies to the long-life and efficient operation of motors—with LOOSITE and SILCO.

Have your service station or dealer first *clean out* your motor with LOOSITE—quickly, safely, economically; then add SILCO to fresh crankcase oil...and to take care of moisture in the gas tank and fuel lines add SILCO to the gas tank. Reduced winter driving hazards will be your quick and lasting rewards.

Petroleum Solvents Corp.

General Offices: 331 Madison Ave., New York 17, N.Y.

P.S. If you heat with oil—write for information on our Fuel Oil Tank Solvent.

Japan's "Mystery Ships"

(Continued from page 228)

south again, in response to a report that the U. S. defenders of San Bernardino Strait were having their troubles with the central Japanese force.

And so they were. Baby flat-tops on watch in the channel found themselves confronted with an overwhelming Jap fleet, including two 45,000-ton battleships. Gallant U. S. destroyers braved mortal peril to lay a smoke screen behind which the light carriers retired—into a providential east wind that enabled them to launch their planes on the run. Circling back, the aircraft pounded the oncoming Japs with such fury that they made slow progress, although they overtook and destroyed a few light American craft. Forcing the passage into the Pacific, the Japs started toward Leyte—and then mysteriously turned back and fled the way they had come.

Evidently their commander, the Navy concludes, must have received word of the fate of the northern Jap force, and also of the southern Jap fleet which had sought to negotiate the Surigao Strait at night. Here Admiral Kinkaid had laid a neat trap of battleships and supporting forces.

Dark silhouettes of the Jap warcraft suddenly stood out against a fiery sky as PT boats, destroyers, and cruisers opened the engagement. Then, with a thunderous crash, the U. S. battleships spoke their piece. Their commander had accomplished an admiral's dream by crossing the enemy's "T," or steaming across the head of his adversary's battle line—which enabled him to bring all his guns to bear while only the forward guns of the enemy ships could reply. To make things perfect, the Japanese elected to escape by turning in column, or follow-the-leader fashion. The first ship gave the range, and practically every subsequent U. S. salvo crashed home. Save for a destroyer or two, every ship of the southern Jap contingent, including the battleships *Fuso* and *Yamashiro*, went to the bottom. In the triple engagement, these two battleships, four carriers, and six Jap cruisers were definitely seen to sink, while 13 other major warships were presumably knocked out of action for from one to six months.

Old scores were settled in that and nearby actions. Five battleships damaged at Pearl Harbor, refitted and as good as new, avenged themselves in the Surigao Strait affair—the *Pennsylvania*, *Maryland*, *Tennessee*, *California*, and *West Virginia*. One other battleship, the *Mississippi*, shared honors with them.

The sun is rising on a new day, a new world

IT'S a day and a world already accepted in the minds of the American people—a world of man-made flight.

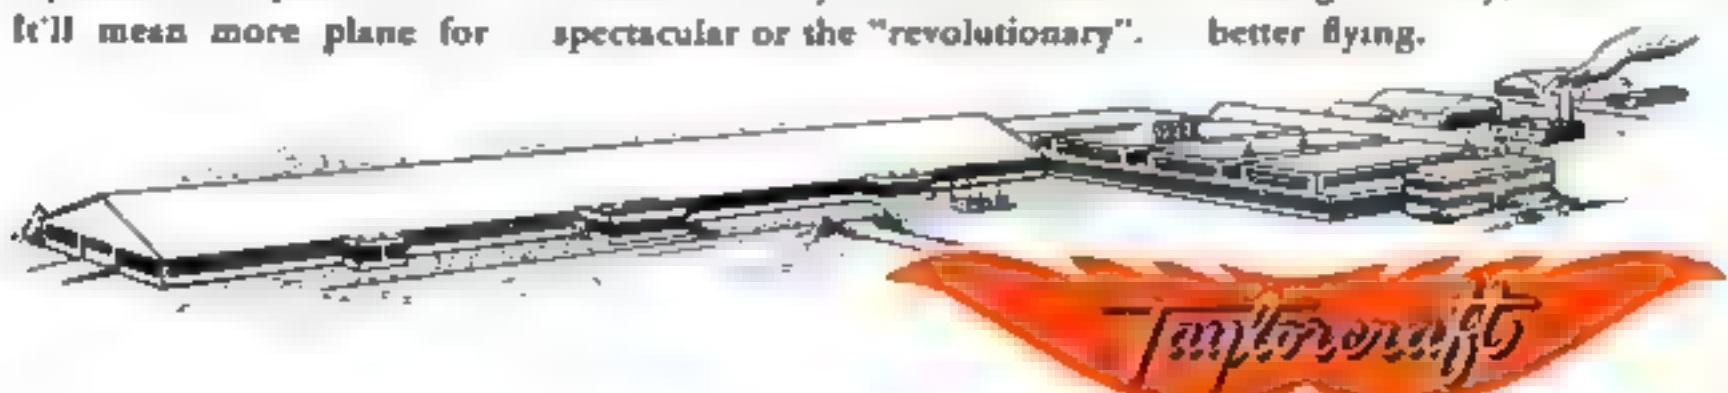

We may not see it this month or this year. But it will come. And when it does the name Taylorcraft will mean just what it means now—just what it has meant for many years . . . the best, the safest, the most dependable airplane in its class. It'll mean more plane for

your money, finer performance, greater stability, longer cruising range, more genuine owner satisfaction and enjoyment.

Prototypes of new 'Crafts are already in the air. Are they revolutionary? The answer is "NO". Sure, great improvements have been made. But at no point has Taylorcraft performance and dependability been sacrificed merely for the sake of the spectacular or the "revolutionary".

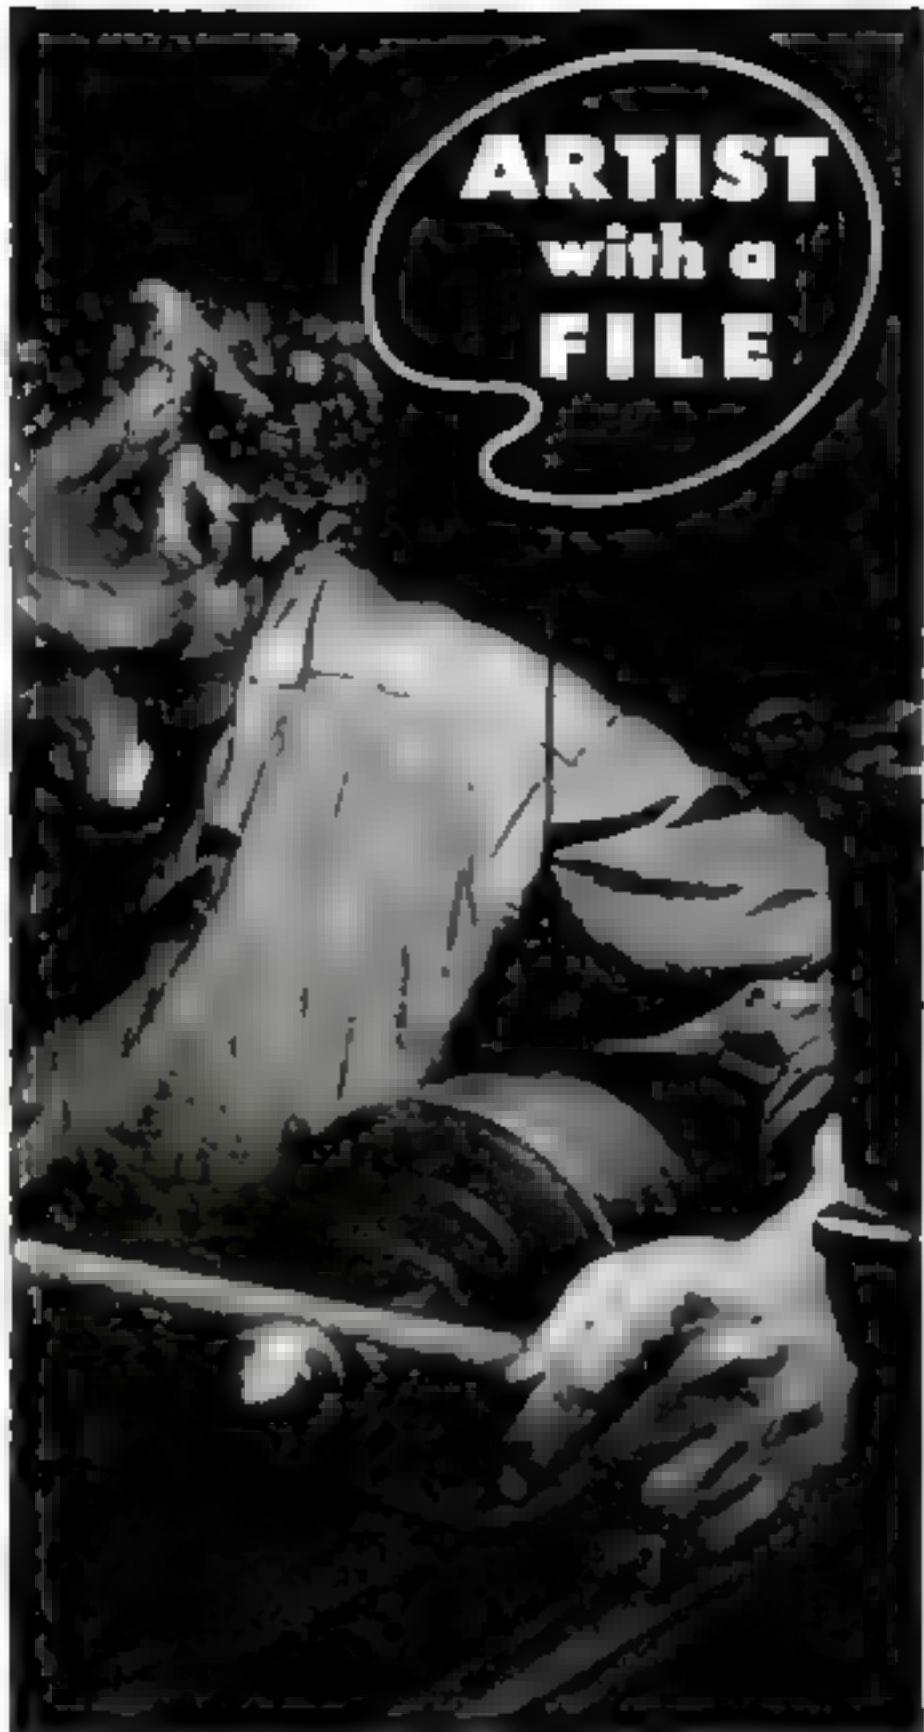

That's why all of us—owners, instructors, fixed base operators—know that we can look forward to this new day with confidence, assurance, and a very real sense of satisfaction.

That's why all of us—private pilots, distributors, dealers—should keep our eyes on Taylorcraft. "The ship with the built-in tailwind" is coming our way, with more and better flying.

World's Largest Builders of Side-by-Side Airplanes

TAYLORCRAFT AVIATION CORPORATION • ALLIANCE, OHIO

It is indeed an art to lathe-file a piece of work to proper dimensions; or to bench-file a precision part to micrometer measurements. Such skill is rarely achieved from practice alone . . . you've got to have *The right file for the job.*

That sound precept helps to explain why there are more than 3000 kinds, cuts and sizes in the Nicholson line of files—each of which can do a certain job on a certain type of metal better, faster or more economically.

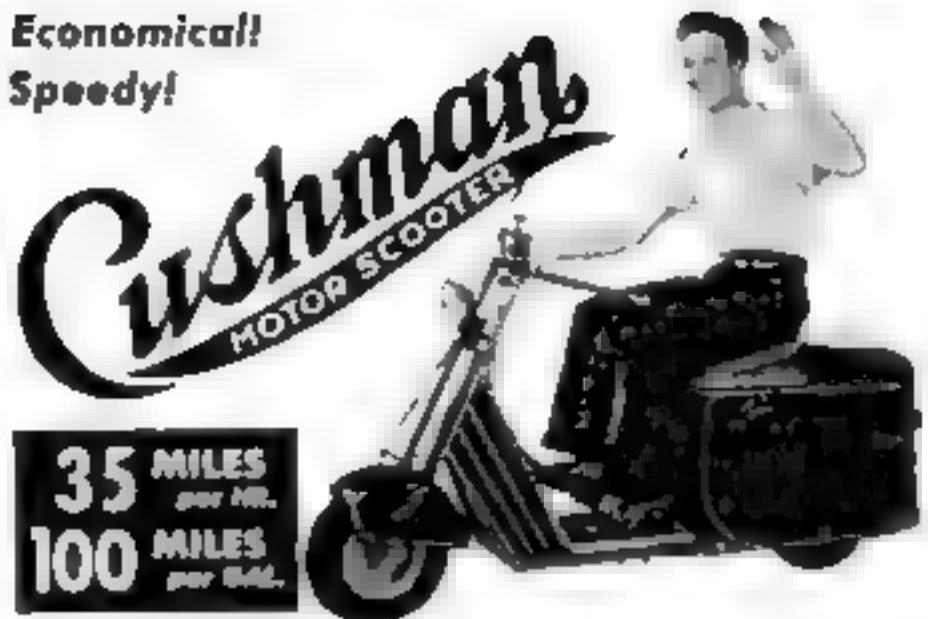

An "M.F." (Master of Files) is a much sought "artist" these days!

MORE THAN 500,000 LAID LOW BY FLU EACH YEAR!

to destroy 'em you have to see 'em

Microscopes are gunsights in Medicine's battle on bacteria.

Optical microscopes, however, were not powerful enough to "draw an accurate bead" on the deadly virus that caused influenza.

But today, medical men have seen what no optical microscope could bring into focus — the infinitesimal influenza virus that previously had lain craftily camouflaged among larger cells.

This revelation came about through the Electron Microscope, developed by scientists at RCA Laboratories. And now, having been seen, influenza may be forced to unconditional surrender, saving the lives of thousands each year.

Here is but one facet of the genius shown by scientists behind RCA

research . . . the "ever-onward" research that saves lives or creates a better radio with equal skill . . . the "there-when-you-need-it" research that gave super-secret equipment to the United Nations . . . the "way-ahead" research that goes into everything made by RCA.

When you buy an RCA radio or phonograph or television set or any RCA product, you get a great satisfaction . . . enjoy a unique pride of ownership in knowing that you possess the very finest instrument of its kind that science has yet achieved.

**They see what human eyes
have never seen before!**

Drs. Arthur W. Vance and James Hilmer, scientists at RCA Laboratories, with Mr. E.W. Engstrom, Research Director (standing), examine the RCA Electron Microscope that has useful magnification up to 100,000 diameters.

WANTED: Man to Run Small Airport!

No experience necessary! You can make money, be your own boss, and run your own business—your own airport! This is the money-making end of aviation, the new postwar industry. Right now you may be a mechanic or a salesman, a small business man or an ex-service man. You don't need a big cash outlay or a fancy set-up. All you need is "know how"—and that's where Aeronca comes in.

Right where you live! Aeronca's been a leader in the personal plane field for more than 16 years, knows how it's done. This company has a complete, profit-making program that tells how to go about making money with a small airport in your own home town. The plan covers more than just selling planes, goes into every last detail—even the money you can make selling gasoline and oil—and that's only a minor part of the business.

The road to success is now in the air. This is one frontier that hasn't been closed. Any man of reasonable intelligence and ambition can build himself a profitable business. It's interesting and it's steady! You can start small and grow big—just like so many other business men. There's no reason why you can't put yourself into this picture. Aeronca shows the way. Just send for the booklets. Use coupon.

Ingenious New Technical Methods

Presented in the hope that they will
prove interesting and useful to you.

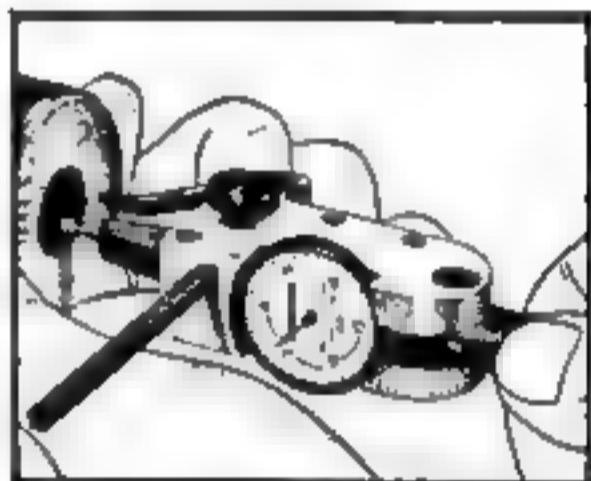

New Internal Gage Avoids Over Cutting . . . Saves Wasted Man Hours

At last a gage that takes the guess work out of checking internal diameters either machine bored, or close ground and lapped. It is called the Keene Internal Gage and is the first accurate method for fast correct checking of internal splines and gears on both minimum and root diameters. The gage is ideal for machining and inspection work, and proves its value in increased production. It can be used with either a master, or micrometers.

This time saving development is constructed of aluminum, is six inches long and weighs only five ounces. Available in models designed to read in thousandths (.001) or in tenths (.0001).

When your gage has been checked the thousandths left to bore, the actual job of machining may become tedious. It is then when Wrigley's Spearmint Gum helps keep you alert and watchful. Chewing gum seems to assist you over the dull spots in the day's work. And Wrigley's Spearmint will aid you in your peacetime job by helping to keep you wide awake and efficient during that part of your work that may seem unimportant, but which actually means perfection to the completed product.

You can get complete information from Keene Electrical Machinery Co., 542 W. Washington Blvd., Chicago 6, Illinois

Determining correct setting for gage.

SHIP MODELS ILLUSTRATED

with a guide to modeling

is the first book of its kind ever published—in all ship models, of real ships, of models, of rigging, of fortifications, of deck gear—covering many types of vessels from whale-boats to PT's from "Slavers" to Corvettes. It incorporates many color plates, closeup photos, detailed drawings and actual construction plans, in addition to a useful text covering ship model building and a glossary of nautical terms. Send for it today. We'll include our catalogue of ship model kits and supplies.

A new principle in optics...born of Universal's war work in precision optical instruments—will make possible greater light-intensity than ever before achieved in a 500-watt home movie projector. Typical of the important developments you'll find throughout Universal's complete CINEMASTER line of home movie needs, as soon as postwar retooling permits. Meanwhile, the P-500 8 mm. projector, now delighting so many owners, is already tooled—all set for production with many improvements, the instant our war work ends.

Manufacturers of Mercury, Cinemaster, Corsair Cameras and Photographic Equipment

HE HAS YOUR BATTERY

Men's lives depend on supplies by air when advance combat units are cut off in enemy territory! Battery-powered parachute lights quickly guide these fighting men to essential food, ammunition and medical equipment. Batteries help light the way to Victory on every fighting front—that's why they are not available here at home. Use your batteries sparingly...keep them cool and dry. Homecraft Happiness

...Why you enjoy more
of it when you use

Delta Homecraft Power Tools

Typical advantages that Delta quality construction gives you:

- ① Double sealed ball bearings you don't have to worry about oiling, because they are lubricated for life.
- ② Precision-hored bearing seats that assure accurate alignment of parts.
- ③ Bearings that are pre-loaded — an extra manufacturing operation that insures longer bearing life.
- ④ Precision-ground shafts to assure true, accurate performance.
- ⑤ Dynamically-balanced pulleys, to eliminate annoying, damaging vibration.

"Hidden values" in construction help assure you of trouble-free performance

In one word, **quality** is the reason why famous Delta Homecraft Power Tools help you enjoy a full measure of the fun handicraft offers you.

You can't always see Delta quality with your eyes. It doesn't make Delta tools look much different than other makes of power tools.

Yet, quality is there!

Accuracy Tells!

Because of quality, you can count on Delta Homecraft Power Tools for accuracy.

You enjoy greater assurance of parts that fit together according to plan, to form finished work that has a look of expert craftsmanship.

Dependability Tells!
Because of quality, Delta Homecraft Power Tools are dependable.

They're always ready to go at the flick of a switch—ready to give you the economical, reliable performance you have a right to expect.

Safety Tells, Too!

And, because of quality, Delta Homecraft Power Tools are safe — meeting the highest safety standards of schools and industry.

You feel free to let other members of your family share in the happiness of your hobby.

Be Sure You Get Quality!

Before you buy any power tools — when they are again available — be sure to learn about all the advantages of Delta Homecraft Power Tools that mean more for your money.

Right now, invest your money in War Bonds! When peace comes, reinvest your accumulated savings wisely in Delta Homecraft Power Tools.

"I HAVEN'T DRIVEN ANYTHING
THIS LIVELY SINCE THE TIME
I PUT BURD GRAF-FLOX PISTON
RINGS IN MY OLD CAR!"

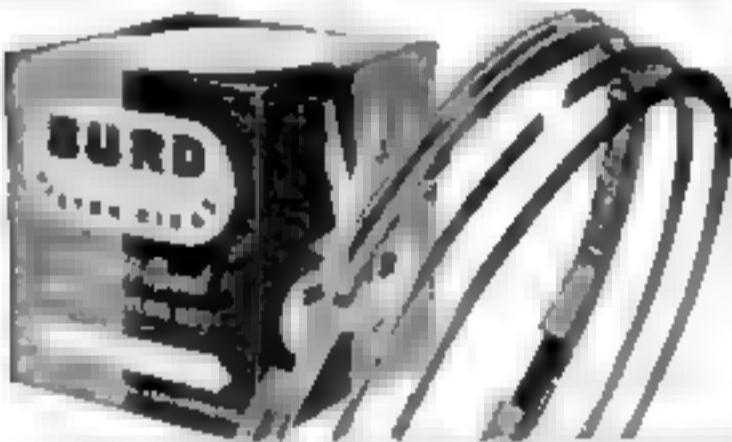

"Graf-Flox" PROCESS ELIMINATES SCORING—SEIZING—SCUFFING

Burd "Graf-Flox" Piston Rings have "built-in lubrication". This is accomplished by: (1) scientifically controlled electric furnaces which produce piston ring iron containing evenly distributed natural graphite; (2) special cleaning methods which fully remove tenacious abrasive particles left by grinding rings to size; (3) an exclusive

"Graf-Floxing" process that applies deeply penetrating colloidal graphite. These steps in manufacture are adding to the life of engines of every sort . . . decreasing oil consumption, increasing gas mileage. Get acquainted with Burd Piston Rings . . . mail the coupon below.

**ONE OF THE
FIRST YANKS**

to Ride a Harley-Davidson Into Germany!

Pvt. Oscar Mc C., writes: "I cannot state the date due to censorship regulations, but I rode my Army 45 Harley-Davidson into Germany shortly after our first troops crossed the border. I know I was one of the first to enter Germany on a Harley-Davidson in this war. And I'll try to be the first Yank to ride into Berlin. Harley-Davidsons are giving 100% performance here in Germany. I know a lot of riders in different outfits over here and they all tell the same story. So just keep on building those good Harley-Davidson Motorcycles, as they are the best in the world."

Okay, Pvt. Oscar Mc C., we'll keep on building good Harley-Davidsons now, and after the war, too — so you and all the rest of the riders can get back to "those good old thrill-packed motorcycling days."

SO IT NEEDS FIXING

By S. T. CHRISTENSEN

the "Fix-it Man"

"WELL, I guess I'm the fellow to see, for I've repaired thousands of refrigerators (home and commercial both), vacuum cleaners, radios, washing machines, irons, fans, lamps, mangles, motors, etc. In fact, many of my customers call me their "electrical appliance doctor." And, "doctoring," I might add, has paid me a good substantial income for quite a few years. Funny, in a way, how I got started. Always liked to tinker and by experimenting around I found that most electrical appliances had many things in common. That, regardless of what the appliance was used for, or who the manufacturer was, the basic principles were much the same. From fixing my own appliances to fixing friends' and then for strangers at a fee, seems now to have been but a small step.

What to Charge?

At first, I let the owner decide the charge and, frankly, I was amazed at what I earned per hour. But then, when one figures what initial costs are involved in buying most electrical appliances, one can readily see that spending extra dollars for repairs is well worth while. Before long I was making more in my spare time repairing than from my regular job. The result . . . I went into business for myself. When war came, business boomed, for new appliances were not available.

For a while, repair parts (needed on some

jobs) were a little difficult to get. But that situation seems to have adjusted itself for many repair parts have today the high priority rating of AA2. After all, we must provide for the health and well-being of our civilian population.

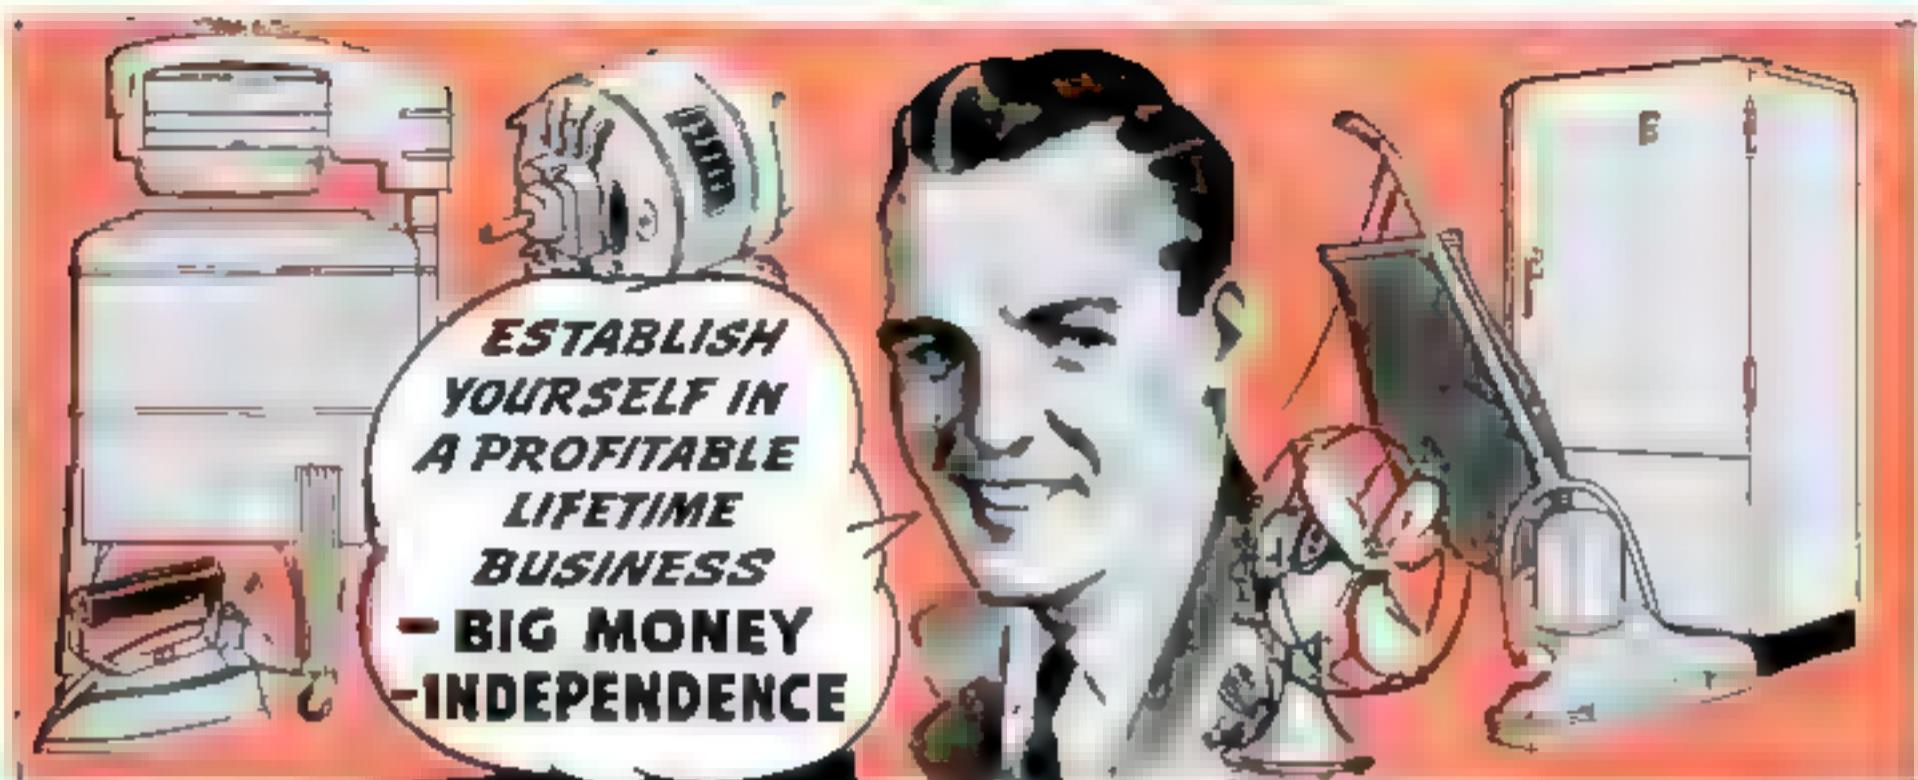

The Future Offers

Friends ask me about my future. And, I think I've got a grand one. Age is no handicap in repairing. I have in my files enthusiastic letters from repairmen ranging in age from 18 to 79 years. After the war, we're bound to see hundreds of new products on the market . . . products that the average person never dreamt of. These new products and our old appliances are all going to need at some time or other "fixing." Well, I'll still be the fellow to do it. The field open for appliance repairmen is unlimited. I don't worry at all about too much competition.

If You Are Ambitious

To the contrary, I've prepared a complete course, chock full of simple, easy to understand photos and drawings and written in the same non-technical language as this article. I know the course is good, because I have hundreds of men all over the country writing to me telling me how the course has helped swell their pockets with cash. If you too want to prepare now for your future, I suggest you read the next page and send me the handy coupon."

Adv.

LEARN ELECTRICAL APPLIANCE REPAIRING

NO EXPERIENCE NEEDED

If you are at all mechanically inclined—that is to say—can hold and use tools—then you have all of the qualifications required for becoming a big money-earning home appliance repairman. It does not matter if you have not had a great deal of schooling or had no previous training along these lines. Age is no barrier . . . nor is any minor physical handicap.

Read What Other Students Say

I really believe your course the best investment a mechanically minded man can make.—Claude E. Allen, Indianapolis, Ind.

Your course on Appliance Servicing is the most complete and up-to-date I have heard of.—Frank Kremen, Tarentum, Penn.

I have received your Course in Appliance Repairing and I must say I am well pleased with same. I am only sorry I did not have said course some years ago. I have learned so much more through this course I would not part with it.—Charles Schwartz, Hamilton, Ohio.

The Course in Appliance Servicing arrived a few days ago. Want to take out a few minutes of my valuable time to let you know that this is just what I have been looking for ever since I opened up my Fix-It shop. I trust admit that you told the truth when you said that it contains quite a bit more information than I bargained for.—P. J. Brett, Sebring, Ohio.

I am a mechanic for the Western Union Telegraph Co. Three days after receiving the lessons in refrigeration I earned the exact cost of the course.—Henry B. Lee, Washington, D. C.

PREPARE FOR THE FUTURE

If now in war work, start your home appliance repair business in your spare time and be set with a business of your own when the war is over. You don't need elaborate fixtures or expensive equipment to be a successful repairman. Operate from your garage, basement, vacant store, etc. Work as many hours as you wish . . . the home appliance repairman is his own boss. It's a profitable occupation for on many types of repairs it is usual for a repairman to charge on the basis of \$5.00 to \$6.00 an hour! Prepare today and make sure of tomorrow's future.

New Course Tells All

Profusely illustrated, our new course shows you in simple, easy to understand language and drawings how to make each repair on refrigerators, vacuum cleaners, washing machines, motors, etc. Explains and gives you a working knowledge of electricity, welding, nickel plating, etc. Shows you how to build the power tools you need and how to solicit and keep business coming to you. Not a theory course but an honest to goodness course written by and used by repairmen the country over. Price of course is so low that the savings on your own household appliance repairs will quickly pay for it. Act now!

SENSATIONAL WAR BARGAINS IN LENSES & PRISMS

All Lenses New, Finely Ground and Polished,
Edges Very Slightly Chipped.

Telescopes Magnifiers Photographic Gadgets
and HUNDREDS OF EXPERIMENTS with these Low Cost LENSES
Come Neatly Packed and Marked—A Salvage Bargain

TANK PRISMS

In order that the tank driver shall not get shot in the face, two of these Silvered Prisms are used to make a periscope. We have secured a number of these that are very slightly chipped, making possible their sale at a very low price. They are 90-45-45 degree prisms of huge size— $5\frac{3}{4}$ " long, $2\frac{1}{2}$ " wide, finely ground and polished. You can use these Prisms to make Periscopes to see over the heads of crowds, to photograph fish under water, to view high or low gauges, etc. Also excellent for experiments, classroom demonstrations at high schools, colleges, camera clubs, astronomy clubs. Some of our ingenious customers have used these Prisms to make camera stereo attachment, photometer tube, range finder, etc.

Normally, these Prisms would retail from about \$24 to \$30 each.

Stock No. 3004-N SILVERED TANK PRISM—Price \$2.00 each Postpaid.

Stock No. 3006-N PLAIN TANK PRISM—Price \$2.00 each Postpaid. This one is excellent for projecting all the colors of the spectrum—a beautiful sight.

FOUR TANK PRISMS—Special—\$7.00 Postpaid
.... This is a sensational bargain opportunity.

PROFESSIONAL BLADE CO.,
NEWARK, 2, NEW JERSEY

Even the choicest tobacco loses its flavor in a pipe that allows bitter juices to seep into the mouthpiece. Steady smokers heartily approve the Royalton Crown pipe because it is uniquely equipped to trap unwanted moisture and slugs. No pipe of its kind possesses the Royalton Crown features—the condensing well and other patented safeguards—that keep bowl and mouthpiece enduringly dry. Smoking luxury within reach of every man.

AMAZING MYSTERY BUTTON

Startles Everybody. With this Electronic Button you can make your own Telephone-Amplifier-Detectorphone. Attach this button to pieces of cardboard—transmit conversation to another room. Music can be transmitted to distant places. Most interesting is that no apparatus ever discovered. Enables you to perform hundreds of experiments. So that it can be connected to dozens of things. A Pre-War Product. Electronic Button including 1000 word instruct. on book is \$1.00. Indicated experiments performed only \$2.00. Electronic Products Company, Saint Charles, Ill.

Have You Heard About My “HAVE-MORE” PLAN?

How to Raise Your Own Delicious Meat, Eggs, Vegetables, Etc. in Your Spare Time on as Little as $\frac{3}{4}$ Acre of Land!

Maybe you already are raising your own food—or at least part of it. Maybe you are even a full-time farmer. Or maybe you are a city dweller just hoping and planning ahead.

Whatever your situation I think you'll be interested in my Plan because it's really a story—the true story of our place of my family and me. It's the story of how we moved to the country outside of New York City. How I kept my regular job and how we've gone in for back yard farming in our spare time!

If you are already doing some thing like this you'll want to "come park notes" with me. Maybe I can give you some new ideas—short cuts—to help you get better results.

If you are not yet doing it but are planning to you'll find my Plan very helpful. It will tell you how to look for the right kind of place near your job, how to get started the easiest, most inexpensive way. My Plan will show you lots of short cuts, help you avoid many mistakes.

"One Hour or So a Day"

Some people may think this sort of thing takes a lot of hard unpleasant work. That is not so! It does take some time—but really not very much. We take care of the chores at our place in only one hour or so a day on the average. It does take some work but it is not unpleasant. It is fast! And it does not take much and even a fairly large city lot can be enough.

The secret, of course, is doing things the easiest, most practical ways taking advantage of all the modern scientific labor-saving methods that have been developed in recent years! And it is these new easier, better methods that my Plan tells you about. See right hand side of this page for list of things my Plan covers.

Mrs. Robinson and our son, Jack. The home-raised goose I'm holding weighed 10½ lbs. at 10 weeks of age. All the food it ate was stale bread and grass growing around our place.

Healthful, Relaxing

Not only is it fun to have a garden and to raise lots of the other foods you need, it's healthful. Really fresh vegetables, in the egg meat etc., have more vitamin and other health-giving qualities in them. They taste much better and, of course, raising your own you can have as you want without worrying about ration points!

Food summers around the place is healthful too. The whole family eats better, sleeps better, feels better and gets along together better. Your children, I am sure, have more white come up roundings. This was of course the soundest foundation for family happiness.

Saves on Food Bills and Ration Points

Food prices are very high now. Every body knows that. So, just figure out how much you'd save if you raised 50% to 75% of all the food you buy. Not only that, it doesn't take any extra time to raise your own! You can have more food, better food and save money doing it!

Security Against Hard Times

Maybe you'd like to retire some day. If there's a post-war depression you might stretch your job longer but it might happen and if it did, wouldn't it be swell to have a place where you could raise most of your food where you could get by with very little cash income? Wouldn't it be a good idea to know how to do these things even if you're not going to? I can tell you it sure gives me a feeling of independence and security, and I'm sure it would do the same for you!

Well, I guess you can see I'm pretty well sold on this whole idea. It's fun. It's healthful. It saves you money, you eat better, you feel secure and independent. That's why I've put the whole story about it in my Have More Plan and why I'm offering my Plan for sale. Price \$1.00. I wish I could give it away to everybody that might be interested but, of course, I can't and after all one dollar isn't very much.

So, if you're interested either to compare notes with me or to plan ahead, then send me your name and address and one dollar and I'll send you my Plan by return mail.

Right now is an excellent time of year to start!

Yours for "a little land and a lot of living."

Ed Robinson

Box 2802, Noroton, Conn.

"A Little Land and a Lot of Living"

NOT A BOOK!

50,000 WORDS • 72 PICTURES, DIAGRAMS

My "HAVE-MORE" Plan tells by clear-cut diagrams, pictures, easy-to-read directions, tables, charts, etc., how we have applied the easiest, most practical, labor-saving methods to having such things at our place. You can easily do the same.

How to choose & to plant the right kind of a piece of your own land for your job. If you don't already have a place?

A wonderfully begun garden with half the work.

Broilers and roasters at about 10 cents a pound.

Fresh eggs 7 minutes a day.

Delicious rabbit meat at 8 cents a pound.

Milk, butter, cheese from your own miniature dairy.

Pigs are easy, why not to have garbage removed?

Geese, turkeys, squabs, ducks, etc. Interesting, delicious.

A lovely flower garden for mother.

New amazingly easy ways of preserving foods that taste far better too.

75 pounds of honey only 8 hours work.

Extra income selling your surplus crops.

Fruit instead of shade trees.

Grapes, berries—your investment back each year.

Etc. Etc. Etc.

What My Plan Tells You about any one of these things can easily be worth several times the price of the whole Plan which is \$1.00. So even if you are interested in only one or two of the subjects you need not hesitate to order my Plan. Besides, if for any reason you aren't more than satisfied with it, I'll gladly refund your dollar without question!

DO YOU WANT TO SEE MY PLAN?

If you do just put a dollar bill or dollar money order (if bank check \$1.00) in an envelope with your name and address and turn it over to "The Farm Mail man." I'll send your copy of my Plan by return mail. If for any reason you aren't pleased with it let me know and I'll refund your money without delay and without question. Address:

A New Low-Cost 18" Drill Press That Can Really Take It

This New Duro 18" Drill Press has been designed and built to handle a much heavier load continuously than ordinary low-priced units. Has many new features including: special design for quick-changing of belts; head casting slotted to provide take-up when wear develops from movement of quill; six-spline telescopic self-aligning spindle that reduces play; heavy ribbed cast iron table and base with large machined surface and grooves for collecting coolant; base provided with "T" slots for bolting jigs; improved simplified depth gauge. Efficient production foot feed available. Specifications include: $\frac{3}{4}$ " capacity. No. 2 Morse Taper. 4 New Departure Ball Bearings. Speed range 425 to 2030 R.P.M. Spindle travel—5". Drills to center of 18" circle. Maximum distance from base to spindle—49". Maximum distance from table to spindle—19". Overall Height—68". Size of overall base—18" x 28 $\frac{1}{2}$ ". Diameter of column—3 $\frac{1}{2}$ ". Weight of Model A3088 (as illustrated) less motor, 350 lbs. Also available in bench model.

Send for Catalog—showing low-cost single and multiple-spindle Drill Presses, Metal-Cutting Band Saws, Circular Saws, Jointers, Routers, Shapers, Grinders, Lathes, Scroll Saws, Flexible Shaft Units, and Portable Electric Drills. Gives full specifications and prices.

New Sickness and Accident Plan Pays \$25 Weekly Benefits

**Costs Only \$12 a Year—Down Payment \$2.50
—Hospital Benefit Included**

Newark, N. J.—The 58-year-old North American Accident Insurance Company of Chicago, announces a new plan that pays \$25 a week for 10 weeks for both stated accidents and sicknesses. Plus an additional \$25 a week for 4 weeks for accidents requiring hospital confinement. Yet the total cost is only \$12 a year. The purpose of this new Premier Limited Double Duty Policy is to bring sickness and accident protection within the reach of men and women who do not have large savings with which to meet sudden doctor or hospital bills, or lost income.

This new plan also has a double-indemnity feature covering travel accidents. You receive \$50 a week if disabled by an accident in a bus, taxicab, street car, train, etc., and \$75 a week if the accident requires hospital confinement. There is another new special feature that pays up to \$25 cash for doctor bills, even for a minor accident such as a cut finger. In case of death by a common accident, the policy pays one thousand dollars cash to your family. Two thousand dollars if caused by a travel accident.

In addition, it covers many common sicknesses such as pneumonia, cancer, appendicitis, etc., paying the weekly benefits whether confined to home or hospital.

The entire cost is only \$12 a year, and that applies to men and women between the ages of 15 and 64 inclusive. Between the ages of 65 and 75 the cost is only \$18 a year. Protects you 24 hours a day. No reduction in benefits regardless of age. No medical examination is required.

Men and women who join the armed forces will receive the full benefits of this protection while in the United States.

North American Accident Insurance Company of Chicago is one of America's great insurance companies, the largest and oldest exclusive health and accident insurance company in this country. It has paid out over \$35,000,000 to grateful policy holders when they needed help most. North American is under the supervision of the Insurance Departments of 47 States and District of Columbia.

Men and women who would like full details about this new plan are urged to write a letter or postcard for a revealing booklet called "Cash or Sympathy." This booklet is absolutely free. It will come by ordinary mail, without charge or obligation of any kind. No one will call to deliver it. We suggest you get a free copy by sending your name and address with postal zone number to Premier Policy Division, North American Accident Insurance Co., 830 Broad Street, Dept. 115, Newark 2, New Jersey.

ASSURE MORE WARMTH AND COMFORT WITH BALSAM-WOOL ATTIC INSULATION

Why let a chilly house dim your social life and dampen your spirits? You can save fuel—and still be more comfortable—by insulating your attic with Balsam-Wool. It's an easy job, and fuel savings often amount to as much as 20% per heating season.

Balsam-Wool Attic Insulation is the way to get lasting comfort, because this original blanket-type, sealed insulation provides lifetime efficiency. Moistureproof, windproof and fire resistant, it is laid like a rug in your attic—no muss or upset.

MONEY BACK IF NOT SATISFIED — If Balsam-Wool does not increase your comfort and fuel savings, your money (including installation costs) is cheerfully refunded. See your lumber dealer now about buying Balsam-Wool on easy monthly payments—or mail the coupon for further information.

Can't Keep Grandma In Her Chair

**She's as Lively as a Youngster—
Now her Backache is better**

Many sufferers relieve nagging backache quickly, once they discover that the real cause of their trouble may be tired kidneys.

The kidneys are Nature's chief way of taking the excess acids and waste out of the blood. They help most people pass about 3 pints a day.

When disorder of kidney function permits poisonous matter to remain in your blood, it may cause nagging backache, rheumatic pains, leg pains, loss of pep and energy, getting up nights, swelling, puffiness under the eyes, headaches and dizziness.

Don't wait! Ask your druggist for Doan's Pills, used successfully by millions for over 40 years. They give happy relief and will help the 15 miles of kidney tubes flush out poisonous waste from your blood. Get Doan's Pills.

INTRODUCING-New Victory Model
HANDIWELD ELECTRIC

ARC WELDER

FULLY
GUARANTEED

RETAILS
ONLY

\$1.95

PLUGS INTO LIGHT SOCKET

Victory Model Handiweld Arc Welder operates from 110 volts. A C or D C current same as other arc welders higher priced generates tremendous heat to weld metal. Not a toy welder that uses carbons but actually uses standard coated rods sizes 1/16" and 3/32". However due to Priority a generous supply of 1/16" rods only are supplied with the welder. Guaranteed not to burn out. Repairs fenders, auto bodies, radiators, machinery parts, etc. Take Victory Model Handiweld anywhere to job, operate right from light socket. You'll find a thousand uses for this welder around your home garage workshop. Also in garages, factories, repair shops, tire shops, mechanics, inventors, plumbers, farmers, etc. Order a Victory Model Handiweld now. SEND NO MONEY. We'll rush one to you with rods, helmet, operating instructions and all necessary parts with the exception of a large jar and a small piece of extension cord; these most everyone has. Pay postage only \$1.95 plus a few cents postage. If not delighted return Victory Model Handiweld in 8 days from receipt and money paid for it will be refunded promptly. Rush your order now.

MOTO-TOOL

THE "POCKET-SIZE" MACHINE SHOP

PUT THIS "WAR VETERAN" TO WORK

Long before Pearl Harbor, Dremel Moto-Tools won their spurs by tackling tough jobs in tool rooms and machine shops. Since the war began, Moto-Tools have earned the respect of every branch of the armed forces. And thousands of them helped establish production records in plants such as General Electric, Westinghouse, Remington Arms, Ford, Nash-Kelvinator, Consolidated Aircraft, Northrup, Douglas and many other arsenals.

Only Moto-Tools Have All These Features

A Model 2 Moto-Tool develops a speed of approximately 27,000 rpm. Weighs only 13 oz. Shaped to fit the hand. Sturdily built. Has shock-proof bakelite housing. Balanced for vibrationless operation. Uses 110-120 A.C. or D.C. current.

HOW TO ORDER

Ask your Dealer about Dremel Moto-Tools and accessories. If he does not handle them, send direct to factory as long as priority ratings are required, ask your War Production Board or your employer for one. Write for FREE CATALOG.

Motorists! up to 30% EXTRA MILEAGE

from EACH GAS STAMP with a

VACU-MATIC

CARBURETOR *Control*

FITS ALL CARS

• Vacu-Matic is constructed of six parts assembled and fused into one unit, adjusted and sealed at the factory. Nothing to regulate. Any motorist can install in ten minutes. The trial offer coupon will bring all the facts. Mail it today!

AGENTS TRIAL OFFER →

• Vacu-Matic offers a splendid opportunity for unusual sales and profits. Every car, truck, tractor and motorcycle owner a prospect. Valuable territories now open. You can obtain one for your own car if you help us introduce it to a friend. Just check and mail the coupon today.

→ You can't change gas rationing, but you can make sure that each precious gallon of gasoline is providing you with the maximum mileage of which your car is capable. Now you can get added mileage . . . plus quicker starting and more power! Make this trial test. Install a Vacu-Matic on your car and get up to 30% extra mileage on a money-back guarantee.

AUTOMATIC SUPER-CHARGE PRINCIPLE

* Vacu-Matic is entirely different! It operates on the supercharge principle by automatically adding a charge of extra oxygen drawn free from the outer air, into the heart of the gas mixture. It is entirely automatic and allows the motor to "breathe" at the correct time, opening and closing automatically.

PROVEN BY TEST

* In addition to establishing new mileage records on cars in all sections of the country, the Vacu-Matic has proven itself on thousands of road tests and on dynamometer tests which duplicate road conditions and record accurate mileage and horsepower increases. Thousands of motorists now enjoy extra mileage—improved performance with Vacu-Matic.

Send this Coupon Today

GOOD NEWS FOR ALL WHO WEAR GLASSES

See Without Glasses

Now you can see easily and clearly—WITHOUT glasses—no matter what your age, or how long you have worn glasses—unless you are one of the FEW who have some degenerative disease of the eye.

In this revealing book, SIGHT WITHOUT GLASSES, Dr. Harold M. Peppard tells why glasses, for most people, are an unnecessary handicap. He clearly explains how a simple, natural course of procedure has helped many to see naturally, discard their glasses permanently and get all the comfort that goes with clear natural sight. He demonstrates how this discovery can save children and adults from putting on glasses.

You'll be Amazed

when you read this remarkable book—study
the case histories of Dr. Peppard's patients
who became—and still wear—glasses

READ WITHOUT GLASSES

Buy this book at any store. Just send your check
postage and handling. This
is a wonderful book.

been
achieved
this week.

NO DRUGS • NO SURGERY • NO TREATMENTS
IF YOUR EYES are not DISEASED
offer you FREEDOM from
in an amazing
SENSATIONAL METHOD of
NATURAL MUSCLE CONTROL
that is available
this week.

IF YOU WEAR
GLASSES

READ THIS

Learn how others have relieved eyestrain, nearsightedness, day-night, astigmatism, and overed or helped such eye troubles as cross-eyes, ptomaine, and cataract.

With Dr. Peppard's Sight Correction Method, you don't need medical or surgical treatment—or wear some uncomfortable glasses. Vision is restored by a scientifically proved system of exercise and muscle control, based on a wonderful new discovery in Ophthalmology.

Unless your eyes are diseased, you don't need glasses. Glasses are not a cure for weak sight. They may make it worse and fall for you. Get rid of lenses. They are more of a crutch than a cure. What you want is normal eyesight. Read now you can receive it in SIGHT WITHOUT GLASSES.

Order Your Copy Before Price Goes Up

Fill out coupon below. Mail it today. When your book arrives, if you are not convinced it will help your eyesight tremendously, return it in ten days and your \$1 will be refunded promptly.

MANUAL

TRANSFORMER WELDERS

WELDING GENERATORS

ARMATURE WINDING

ELECTRIC OUTBOARD

POWER TOOLS

WIND PLANTS

ELECT. GO BIKE

MOTORS

INSECT KILLERS

ELECTRIC SCOOTER

ELECTRIC FENCERS

LIGHT GENERATORS

TRACTOR LIGHTS

THERE'S LOTS OF ENJOYMENT
IN THESE PROJECTS

Making practical things that work and save money is always fascinating, especially when you can do it in spare time and with spare equipment you may have in your own garage or workshop. If you need a welder, you can make that, too. In fact, the fifty basic plans in the LeJay Manual contain instructions that will enable you to make 100 or more individual items. Think of the extra money you can earn making and repairing things for other people.

LEARN HOW TO BUILD

- 200 Amp. Generator Welders
- Workshop Spot Welder
- Large Transformer Welders
- Gunsmit's Carbon Welder
- Electric Feeders
- Armature Rewinding
- Bench Grinders
- 6, 12, 32 and 110-Volt Motors
- Wind Driven Light Plant
- Insect Electrocutors
- Electric Bicycle Pusher
- and Many Other Things.

PLANS EASY TO FOLLOW

These plans were made for YOU and others like you, who are not in any sense electrical experts or mechanics. They are simple, yet efficient, and do not need a lot of expensive tools to carry them out. Thousands of amateurs are having fun or making profits with the many things these plans helped them to build. The illustrations shown are only a few of the many things you can make.

PRECISION-BUILT FOR PRECISION WORK

Precision work can be no more exact than the machine on which it is produced. This is why so many war plants, known the world over for the perfection of their products, rely upon precision-built South Bend Lathes for handling operations that demand machining to close tolerances.

While precision is measurable only in the finished work piece, it is the direct result of the lathe's design and construction. Unusually large spindle bearings, belt drive to spindle, hand-scraped bed ways, rigidity, and smooth operation are some of the features that make South Bend Lathes capable of the most exacting precision operations.

Today, as always, our entire factory is devoted exclusively to the production of South Bend Precision Lathes. No other product is made by us. There has been no lowering of quality standards because of wartime restrictions or shortages. The use of substitute materials is negligible, limited only to non-essential parts such as name plates, paint, etc. Improvements have been accelerated.

The performance records that these lathes are setting now on war production work forecast their value for tomorrow when accuracy and production costs become critical competitive factors in post-war enterprise.

South Bend Engine Lathes and Toolroom Lathes are made in five sizes: 9", 10", 13", 14½", and 16" swing. The Precision Turret Lathes are available in two sizes: ½" and 1" collet capacity.

"HOW TO RUN A LATHE"

A helpful handbook on the operation and care of engine lathes. Contains 128 pages, 5½" x 8". Price 25c. Stamps accepted for single copies.

This Guide May Save a Loved
One Quickly What You Can Do

SUPPOSE your child falls on a broken bone and begins spouting red blood—what to do? Precious! With this "AIDIAL" FIRST AID GUIDE you'll know instantly. Look at the dial with your thumb to the corresponding number and pass your fingers through the upper window. There it is—your wound." Look in the other round window—twist a towel or other "tourniquet" point. Then the bleeding will stop; your little one can get him to a doctor. "AIDIAL" will help in emergencies: DROWNING, SUNSTROKE, BURNING, SNAKEBITE, BLEEDING FROM A BONE, VEINS, SPRAINS, DISLOCATIONS, SIMPLE FRACTURE, SKULL FRACTURE, FOREIGN BODY ASPHYXIATION, GAS POISONING, ETC. ALCOHOL POISONING • In addition it gives courses of the arteries and correct pressure, straining artificial respiration; and a table of first aid measures.

AT LAST! A reliable source of easily understood, up-to-date health information on health and sickness—a valuable health encyclopedia in one handy volume filled with illustrations! It gives you a wealth of authoritative facts to help you preserve and improve health—how to recognize all diseases. From A to Z, things you want to know about DISEASE, causes, symptoms, what to do in sudden attacks, PROBLEMS of youth and middle age; HIGH BLOOD PRESSURE, ARTERIO-SCLEROSIS, APoplexy; facts about CER, and its early detection; DIABETES, value of a correct diet; ARTHRITIS, SCIATICA, LUMBAGO.

842 Pages of Health and Life-Saving Information

930 PICTURES

The wonderful illustrations are a revelation in themselves. They picture for you the details of the human body—its organs, muscles, nerves, bones, circulation, digestion, etc., as well as the location and character of symptoms of disease. Scores of pictures show you how to do things. Action pictures show each step in the care of the sick. There are an average of more than one to each page. This book is fascinating as it is valuable.

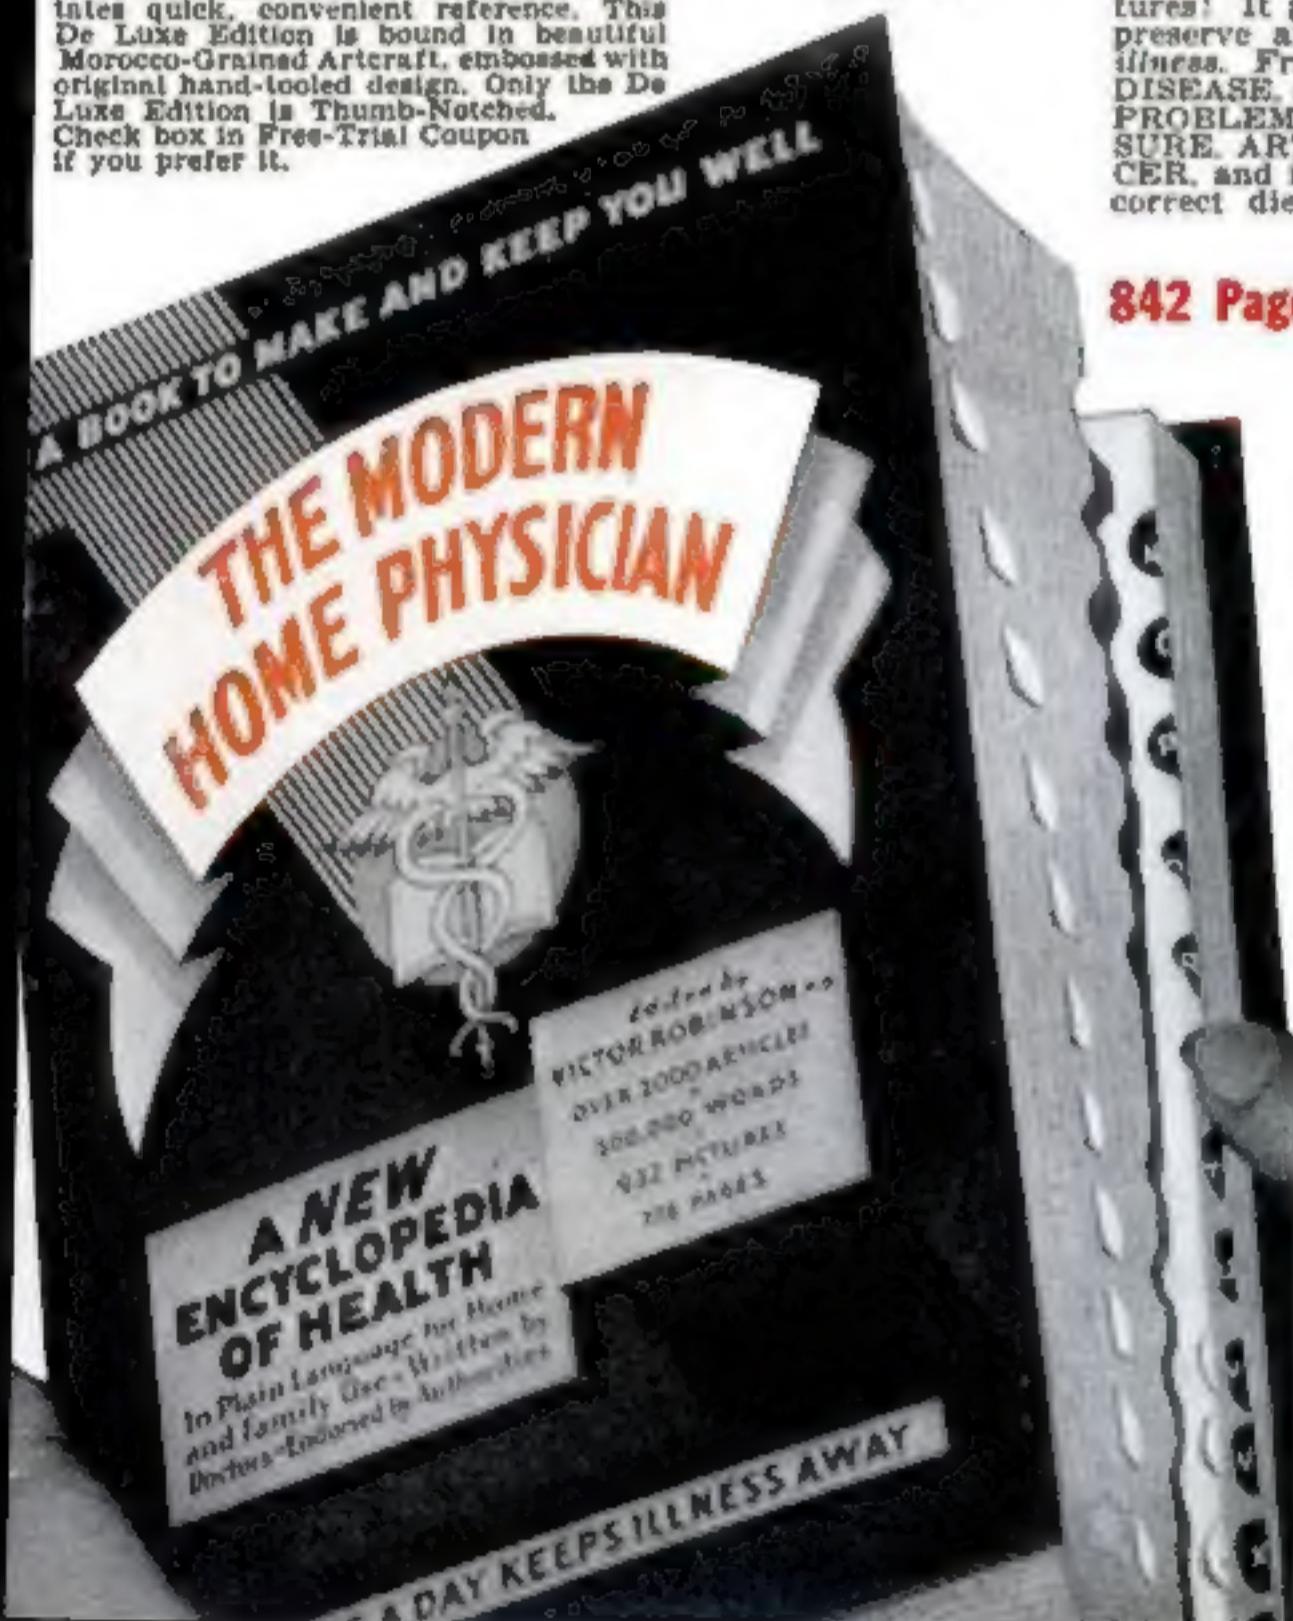

Editor Famous in Medical World

Every one of the more than 2,000 articles in this Encyclopedia of Health and Sickness was written by a specialist in his field. A large staff of specialists collaborated. The entire work was gone over to the last detail by Dr. Victor Robinson, M.D., Professor of History of Medicine in Temple University, and Chief of the Medical Review of Reviews, an International journal.
